## 6. THE PELL EQUATIONS

Equation (3) is the special case $d=2$ of the equation

$$
\begin{equation*}
s^{2}-d t^{2}=1 \tag{18}
\end{equation*}
$$

where $d$ is positive and is not a perfect square. Equation (18) is known as the Pell equation. Another way of solving Eq. (3) is provided by the following theorem concerning the Pell equations found in most text books on the theory of numbers. (For a proof of the theorem, see [2].)

Theorem: If $\left(s_{1}, t_{1}\right)$ is the minimal positive solution of Eq. (18), then every positive solution is given by

$$
\begin{equation*}
s_{n}+t_{n} \sqrt{d}=\left(s_{1}+t_{1} \sqrt{d}\right)^{n}, \quad n>0 \tag{19}
\end{equation*}
$$

(A solution ( $\mathrm{s}, \mathrm{t}$ ) is called positive if $\mathrm{s}>0, \mathrm{t}>0$.) The minimal positive solution of Eq. (3) is (3,2). Then, according to this theorem, all positive solutions are given by

$$
\begin{equation*}
\mathrm{s}_{\mathrm{n}}+\mathrm{t}_{\mathrm{n}} \sqrt{2}=(3+2 \sqrt{2})^{\mathrm{n}}, \quad \mathrm{n}=1,2,3, \cdots \tag{20}
\end{equation*}
$$

Equations (15) and (16) are easily derived from Eq. (20) as follows:

$$
\begin{aligned}
\mathrm{s}_{\mathrm{n}}+\mathrm{t}_{\mathrm{n}} \sqrt{2}=(3+2 \sqrt{2})^{\mathrm{n}} & =(3+2 \sqrt{2})^{\mathrm{n}-1}(3+2 \sqrt{2})=\left(\mathrm{s}_{\mathrm{n}-1}+\mathrm{t}_{\mathrm{n}-1} \sqrt{2}\right)(3+2 \sqrt{2}) \\
& =\left(3 \mathrm{~s}_{\mathrm{n}-1}+4 \mathrm{t}_{\mathrm{n}-1}\right)+\left(2 \mathrm{~s}_{\mathrm{n}-1}+3 \mathrm{t}_{\mathrm{n}-1}\right) \sqrt{2}
\end{aligned}
$$

Therefore $\mathrm{s}_{\mathrm{n}}=3 \mathrm{~s}_{\mathrm{n}-1}+4 \mathrm{t}_{\mathrm{n}-1}$, and $\mathrm{t}_{\mathrm{n}}=2 \mathrm{~s}_{\mathrm{n}-1}+3 \mathrm{t}_{\mathrm{n}-1}$.

## 7. RECURRENCE RELATIONS

If $\left(x_{n}, z_{n}\right)$ is one of the sequence of non-negative solutions of Eq. (1) with $n \geq 2$, we can derive from Eqs. (7) and (8) a formula that expresses $x_{n}$ ${ }^{\star}$ Part I appeared in the December 1968 Issue.
as a linear function of $x_{n-1}$ and $x_{n-2}$, and a formula that expresses $z_{n}$ as a linear function of $z_{n-1}$ and $z_{n-2}$. If we replace $n$ by $n-1$ in Eqs. (7) and (8), we get
(21)

$$
\begin{aligned}
& x_{n-1}=3 x_{n-2}+2 z_{n-2}+1 \\
& z_{n-1}=4 x_{n-2}+3 z_{n-2}+2
\end{aligned}
$$

From (21) and (22) we get

$$
\begin{align*}
& 2 z_{n-2}=x_{n-1}-3 x_{n-2}-1  \tag{23}\\
& 4 x_{n-2}=z_{n-1}-3 z_{n-2}-2 \tag{24}
\end{align*}
$$

Then, from Eqs. (7), (22) and (23),

$$
\begin{gathered}
x_{n}=3 x_{n-1}+2 z_{n-1}+1 \\
x_{n}=3 x_{n-1}+2\left(4 x_{n-2}+3 z_{n-2}+2\right)+1 \\
x_{n}=3 x_{n-1}+8 x_{n-2}+6 z_{n-2}+5 \\
x_{n}=3 x_{n-1}+8 x_{n-2}+3\left(x_{n-1}-3 x_{n-2}-1\right)+5
\end{gathered}
$$

$$
\begin{equation*}
x_{n}=6 x_{n-1}-x_{n-2}+2 \tag{25}
\end{equation*}
$$

Similarly, from Eqs. (8), (21) and (24),

$$
\begin{gathered}
z_{n}=4 x_{n-1}+3 z_{n-1}+2 \\
z_{n}=4\left(3 x_{n-2}+2 z_{n-2}+1\right)+3 z_{n-1}+2 \\
z_{n}=12 x_{n-2}+8 z_{n-2}+3 z_{n-1}+6 \\
z_{n}=3\left(z_{n-1}-3 z_{n-2}-2\right)+8 z_{n-2}+3 z_{n-1}+6
\end{gathered}
$$

$$
z_{n}=6 z_{n-1}-z_{n-2}
$$

## EXERCISES

5. Let $\left(u_{n}, v_{n}\right)$ be the $n^{\text {th }}$ solution in positive integers of Eq. (2), $\mathrm{n} \geq 2$. Use Eqs. (12) and (13) to derive the recurrence relations

$$
\begin{gather*}
u_{n}=6 u_{n-1}-u_{n-2}+2  \tag{27}\\
v_{n}=6 v_{n-1}-v_{n-2} \tag{28}
\end{gather*}
$$

6. Let $\left(s_{n}, t_{n}\right)$ be the $n^{\text {th }}$ solution in positive integers of Eq. (3), $n$ $\geq 2$. Use Eqs. (15) and (16) to derive the recurrence relations

$$
\begin{align*}
& s_{n}=6 s_{n-1}-s_{n-2}  \tag{29}\\
& t_{n}=6 t_{n-1}-t_{n-2} . \tag{30}
\end{align*}
$$

## 8. CLOSED FORMULAS

If a sequence $y_{0}, y_{1}, y_{2}, \cdots, y_{7}, \cdots$ is defined by specifying the values of the first few terms and determining the values of the rest inductively by means of a linear recurrence relation, then there is a standard technique for finding a formula that expresses $y_{n}$ in terms of $n$. For example, it can be shown that if the recurrence relation is the equation

$$
\begin{equation*}
\mathrm{y}_{\mathrm{n}+2}-6 \mathrm{y}_{\mathrm{n}+1}+\mathrm{y}_{\mathrm{n}}=0 \tag{31}
\end{equation*}
$$

then

$$
\begin{equation*}
\mathrm{y}_{\mathrm{n}}=\mathrm{c}_{1} \mathrm{r}_{1}^{\mathrm{n}}+\mathrm{c}_{2} \mathrm{r}_{2}^{\mathrm{n}} \tag{32}
\end{equation*}
$$

where $r_{1}$ and $r_{2}$ are the roots of the characteristic equation

$$
\begin{equation*}
E^{2}-6 E+1=0 \tag{33}
\end{equation*}
$$

and the constants $c_{1}$ and $c_{2}$ are determined by the values of $y_{1}$ and $y_{2}$. (See [3] for a proof of this assertion.) The roots of (33) are $3+2 \sqrt{2}$ and 3 $-2 \sqrt{2}$. So in this case

$$
\begin{equation*}
\mathrm{y}_{\mathrm{n}}=\mathrm{c}_{1}(3+2 \sqrt{2})^{\mathrm{n}}+\mathrm{c}_{2}(3-2 \sqrt{2})^{\mathrm{n}} \tag{34}
\end{equation*}
$$

The recurrence relations for $z_{n}, v_{n}, s_{n}$ and $t_{n}$ all have the form (31) with characteristic equation (33). Hence the closed formulas for $z_{n}, v_{n}, s_{n}$ and $t_{n}$ all have the form of Eq. (34), and differ only in the values of the constants $c_{1}$ and $c_{2}$. To determine the constants in the formula

$$
\mathrm{z}_{\mathrm{n}}=\mathrm{c}_{1}(3+2 \sqrt{2})^{\mathrm{n}}+\mathrm{c}_{2}(3-2 \sqrt{2})^{\mathrm{n}}
$$

we make use of the fact that $z_{0}=1$ and $z_{1}=5$. Then

$$
\begin{aligned}
& 1=c_{1}\left(3+2 \sqrt{2}^{0}+c_{2}(3-2 \sqrt{2})^{0}\right. \\
& 5=c_{1}\left(3+2 \sqrt{2}^{1}+c_{2}(3-2 \sqrt{2})^{1}\right.
\end{aligned}
$$

Therefore $c_{1}+c_{2}=1$ and $c_{1}-c_{2}=\frac{1}{2} \sqrt{2}$. Consequently, $c_{1}=\frac{1}{4}(2+\sqrt{2}), c_{2}$ $=\frac{1}{4}(2-\sqrt{2})$, and

$$
\begin{equation*}
a=\frac{1}{4}\left[(2+\sqrt{2})(3+2 \sqrt{2})^{n}+(2-\sqrt{2})(3-2 \sqrt{2})^{n}\right] \tag{35}
\end{equation*}
$$

## EXERCISES

7. Determine the values of $c_{1}$ and $c_{2}$ in each of these closed formulas:

$$
\begin{align*}
& \mathrm{s}_{\mathrm{n}}=\mathrm{c}_{1}\left(3+2 \sqrt{2}^{\mathrm{n}}+\mathrm{c}_{2}\left(3-2 \sqrt{2}^{\mathrm{n}}\right.\right.  \tag{36}\\
& \mathrm{t}_{\mathrm{n}}=\mathrm{c}_{1}\left(3+2 \sqrt{2}^{\mathrm{n}}+\mathrm{c}_{2}\left(3-2 \sqrt{2}^{\mathrm{n}}\right.\right.  \tag{37}\\
& \mathrm{v}_{\mathrm{n}}=\mathrm{c}_{1}\left(3+2 \sqrt{2}^{\mathrm{n}}+\mathrm{c}_{2}\left(3-2 \sqrt{2}^{\mathrm{n}}\right.\right. \tag{38}
\end{align*}
$$

It can be shown that if the recurrence relation defining a sequence $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ is the non-homogeneous equation

$$
\begin{equation*}
\mathrm{y}_{\mathrm{n}+2}-6 \mathrm{y}_{\mathrm{n}+1}+\mathrm{y}_{\mathrm{n}}=2 \tag{39}
\end{equation*}
$$

then

$$
\begin{equation*}
\mathrm{y}_{\mathrm{n}}=\mathrm{c}_{1} \mathrm{r}_{1}^{\mathrm{n}}+\mathrm{c}_{2} \mathrm{r}_{2}^{\mathrm{n}}-\frac{1}{2} \tag{40}
\end{equation*}
$$

where $r_{1}$ and $r_{2}$ are the roots of (33), and $c_{1}$ and $c_{2}$ are determined by the values of $y_{0}$ and $y_{1}$. The recurrence relations for $x_{n}$ and $u_{n}$ have the form of (40). Hence the closed formulas for $x_{n}$ and $u_{n}$, after evaluation of the constants $c_{1}$ and $c_{2}$, are

$$
\begin{gather*}
\mathrm{x}_{\mathrm{n}}=\frac{1}{4}\left[(1+\sqrt{2})\left(3+2 \sqrt{2}^{\mathrm{n}}+(1-\sqrt{2})(3-2 \sqrt{2})^{\mathrm{n}}-2\right]\right.  \tag{41}\\
u_{\mathrm{n}}=\frac{1}{4}\left[\left(3+2 \sqrt{2}^{\mathrm{n}}+\left(3-2 \sqrt{2}^{\mathrm{n}}\right)^{\mathrm{n}}-2\right]\right. \tag{42}
\end{gather*}
$$

## 9. HOW EQUATIONS (1), (2), AND (3) ARE RELATED TO EACH OTHER

The sequence of non-negative integers $\left\{z_{n}\right\},\left\{v_{n}\right\}$ and $\left\{t_{n}\right\}$ which arise in the solution of Eqs. (1), (2) and (3), respectively, all satisfy the same recurrence relation (31). This shows that the solutions of Eqs. (1), (2) and (3) are intimately related to each other. We shall now derive the equations that relate them to each other from the closed formulas for $x_{n}, z_{n}, s_{n}, t_{n}, u_{n}$ and $v_{n}$. The formulas for $z_{n}, x_{n}$ and $u_{n}$ are Eqs. (35), (41) and (42), respectively. The formulas for $\mathrm{s}_{\mathrm{n}}, \mathrm{t}_{\mathrm{n}}$ and $\mathrm{v}_{\mathrm{n}}$ obtained in Exercise 7 are

$$
\begin{align*}
& \mathrm{s}_{\mathrm{n}}=\frac{1}{2}\left[\left(3+2 \sqrt{2}^{\mathrm{n}}+(3-2 \sqrt{2})^{\mathrm{n}}\right]\right. \\
& \mathrm{t}_{\mathrm{n}}=\frac{\sqrt{2}}{4}\left[\left(3+2 \sqrt{2}^{\mathrm{n}}-\left(3-2 \sqrt{2}^{\mathrm{n}}\right)^{\mathrm{n}}\right]\right. \\
& \mathrm{v}_{\mathrm{n}}=\frac{\sqrt{2}}{8}\left[\left(3+2 \sqrt{2}^{\mathrm{n}}-\left(3-2 \sqrt{2}^{\mathrm{n}}\right)^{\mathrm{n}}\right]\right.
\end{align*}
$$

By solving Eqs. (42) and (38') for $\left(3+2 \sqrt{2}^{\mathrm{n}}\right.$ and $(3-2 \sqrt{2})^{\mathrm{n}}$, respectively, we find

$$
\begin{equation*}
(3+2 \sqrt{2})^{n}=2 u_{n}+2 \sqrt{2} v_{n}+1 \tag{43}
\end{equation*}
$$

[Apr.

$$
\begin{equation*}
(3-2 \sqrt{2})^{n}=2 u_{n}-2 \sqrt{2} v_{n}+1 \tag{44}
\end{equation*}
$$

Making these substitutions for $(3+2 \sqrt{2})^{n}$ and $(3-2 \sqrt{2})^{n}$ in Eqs. (41) and (35), we obtain the following equations relating the solutions $\left(x_{n}, z_{n}\right)$ of Eq. (1) to the solutions $\left(u_{n}, v_{n}\right)$ of Eq. (2):

$$
\begin{gather*}
x_{n}=u_{n}+2 v_{n}  \tag{45}\\
z_{n}=2 u_{n}+2 v_{n}+1
\end{gather*}
$$

If we solve Eqs. (45) and (46) for $u_{n}$ and $v_{n}$, we get these equations:

$$
\begin{align*}
& u_{n}=z_{n}-x_{n}-1  \tag{47}\\
& v_{n}=\frac{1}{2}\left(2 x_{n}-z_{n}+1\right)
\end{align*}
$$

## EXERCISES

8. Use Eqs. $\left(36^{\prime}\right)$, (37'), (43) and (44) to derive these equations relating the solutions $\left(s_{n}, t_{n}\right)$ of Eq. (3) to the solutions $\left(u_{n}, v_{n}\right)$ of Eq. (2):

$$
\begin{gather*}
s_{n}=2 u_{n}+1  \tag{49}\\
t_{n}=2 v_{n} \tag{50}
\end{gather*}
$$

$$
\begin{equation*}
u_{n}=\frac{1}{2}\left(s_{n}-1\right) \tag{51}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{v}_{\mathrm{n}}=\frac{1}{2} \mathrm{t}_{\mathrm{n}} \tag{52}
\end{equation*}
$$

9. Use the results of Exercise 8 and the paragraph that precedes it to derive these equations relating the solutions $\left(s_{n}, t_{n}\right)$ of Eq. (3) to the solutions ( $\mathrm{x}_{\mathrm{n}}, \mathrm{z}_{\mathrm{n}}$ ) of Eq. (1):

$$
\begin{equation*}
s_{n}=2 z_{n}-2 x_{n}-1 \tag{53}
\end{equation*}
$$

$$
\begin{gather*}
t_{n}=2 x_{n}-z_{n}+1  \tag{54}\\
x_{n}=\frac{1}{2}\left(s_{n}+2 t_{n}-1\right),  \tag{55}\\
z_{n}=s_{n}+t_{n}
\end{gather*}
$$

10. Without using the closed formulas (41), (35), (42) and (38') for $x_{n}$, $z_{n}, u_{n}$ and $v_{n}$, respectively, verify that if $\left(x_{n}, z_{n}\right)$ is a solution of Eq. (1), in non-negative integers, and $u_{n}$ and $v_{n}$ are defined by Eqs. (47) and (48), respectively, then $u_{n}$ and $v_{n}$ are non-negative integers, and $\left(u_{n}, v_{n}\right)$ is a solution of Eq. (2). Also verify, conversely, that if ( $u_{n}, v_{n}$ ) is a solution of Eq. (2) in non-negative integers, and $x_{n}$ and $z_{n}$ are defined by Eqs. (45) and (46), respectively, then $x_{n}$ and $z_{n}$ are non-negative integers, and ( $x_{n}, z_{n}$ ) is a solution of Eq. (1). (See [1], pp. 20-21.)
11. Without using the closed formulas for $x_{n}, z_{n}, s_{n}$, and $t_{n}$, verify that if $\left(x_{n}, z_{n}\right)$ is a solution of Eq. (1) in non-negative integers, and $s_{n}$ and $t_{n}$ are defined by Eqs. (53) and (54), respectively, then $s_{n}$ and $t_{n}$ are nonnegative integers, and $\left(s_{n}, t_{n}\right)$ is a solution of Eq. (3). Also verify, conversely, that if ( $s_{n}, t_{n}$ ) is a solution of Eq. (3) in non-negative integers, and $x_{n}$ and $z_{n}$ are defined by Eqs. (55) and (56), respectively, then $x_{n}$ and $z_{n}$ are non-negative integers, and $\left(x_{n}, z_{n}\right)$ is a solution of Eq. (1).

If we drop the subscripts in Eqs. (45) through (56), each pair of equations, (45) and (46), (47) and (48), (49) and (50), (51) and (52), (53) and (54), and (55) and (56), defines a linear transformation that converts one of the Eqs. (1), (2) or (3) into one of the other two.
10. FORMULAS FOR GENERATING SIMULTANEOUSLY SUCCESSIVE SOLUTIONS OF EQUATIONS (1), (2), AND (3)

From Eqs. (45) and (50) we get

$$
\begin{equation*}
x_{n}=u_{n}+t_{n} \tag{57}
\end{equation*}
$$

From Eqs. (45), (46), (12) and (13), we get
[Apr.

$$
\begin{align*}
& u_{n+1}=x_{n}+z_{n}  \tag{58}\\
& v_{n+1}=v_{n}+z_{n} \tag{59}
\end{align*}
$$

Then, starting with $u_{0}=0, v_{0}=0$, and applying recursively the sequence of Eqs. (49), (50), (57), (56), (58) and (59), we can generate in succession $\mathrm{s}_{0}$, $\mathrm{t}_{0}, \mathrm{x}_{0}, \mathrm{z}_{0}, \mathrm{u}_{1}, \mathrm{v}_{1}, \mathrm{~s}_{1}, \mathrm{t}_{1}, \mathrm{x}_{1}, \mathrm{z}_{1}, \mathrm{u}_{2}, \mathrm{v}_{2}, \mathrm{~s}_{2}, \mathrm{t}_{2}, \mathrm{x}_{2}, \mathrm{z}_{2}$, and so on. The first ten non-negative solutions to Eqs. (2), (3) and (1), respectively, obtained in this way, are tabulated below.

| n | $\left(\mathrm{u}_{\mathrm{n}}, \mathrm{v}_{\mathrm{n}}\right)$ | $\left(\mathrm{s}_{\mathrm{n}}, \mathrm{t}_{\mathrm{n}}\right)$ | $\left(\mathrm{x}_{\mathrm{n}}, \mathrm{z}_{\mathrm{n}}\right)$ |
| :--- | :---: | :---: | :---: |
| 0 | $(0,0)$ | $(1,0)$ | $(0,1)$ |
| 1 | $(1,1)$ | $(3,2)$ | $(3,5)$ |
| 2 | $(8,6)$ | $(17,12)$ | $(20,29)$ |
| 3 | $(49,35)$ | $(99,70)$ | $(119,169)$ |
| 4 | $(288,204)$ | $(577,408)$ | $(696,985)$ |
| 5 | $(1681,1189)$ | $(3363,2378)$ | $(4059,5741)$ |
| 6 | $(9800,6930)$ | $(19601,13860)$ | $(23660,33461)$ |
| 7 | $(57121,40391)$ | $(114243,80782)$ | $(137903,195025)$ |
| 8 | $(332928,235416)$ | $(665857,470832)$ | $(803760,1136689)$ |
| 9 | $(1940449,1372105)$ | $(3880899,2744210)$ | $(4684659,6625109)$ |

## EXERCISE

12. Find $\left(\mathrm{u}_{10}, \mathrm{v}_{10}\right),\left(\mathrm{s}_{10}, \mathrm{t}_{10}\right)$ and $\left(\mathrm{x}_{10}, \mathrm{z}_{10}\right)$.

## 11. SOLU'TIONS WITH EVEN OR ODD INDEX

It is of interest to examine separately the even-numbered solutions ( $\mathrm{x}_{2 \mathrm{i}}$, $\left.z_{2 i}\right),\left(u_{2 i}, v_{2 i}\right)$ and $\left(s_{2 i}, t_{2 i}\right)$ of Eqs. (1), (2) and (3), respectively, and the odd-numbered solutions $\left(\mathrm{x}_{2 \mathrm{i}+1}, \mathrm{z}_{2 \mathrm{i}+1}\right)$, $\left(\mathrm{u}_{2 \mathrm{i}+1}, \mathrm{v}_{2 \mathrm{i}+1}\right)$ and $\left(\mathrm{s}_{2 \mathrm{i}+1}, \mathrm{t}_{2 \mathrm{i}+1}\right)$. These solutions can be expressed in terms of the solutions $\left(x_{i}, z_{i}\right),\left(u_{i}, v_{i}\right)$ and $\left(s_{i}, t_{i}\right)$. For example, we know from Eq. (20) that

$$
s_{2 i}+t_{2 i} \sqrt{2}=(3+2 \sqrt{2})^{2 i}=\left[(3+2 \sqrt{2})^{i}\right]^{2}=\left(s_{i}+t_{i} \sqrt{2}\right)^{2}
$$

That is,

$$
\mathrm{s}_{2 \mathrm{i}}+\mathrm{t}_{2 \mathrm{i}} \sqrt{2}=\left(\mathrm{s}_{\mathrm{i}}^{2}+2 \mathrm{t}_{\mathrm{i}}^{2}\right)+2 \mathrm{~s}_{\mathrm{i}} \mathrm{t}_{\mathrm{i}} \sqrt{2}
$$

Therefore

$$
\begin{equation*}
s_{2 i}=s_{i}^{2}+2 t_{i}^{2}=2 s_{i}^{2}-1=1+4 t_{i}^{2} \tag{60}
\end{equation*}
$$

and
(61)

$$
t_{2 i}=2 s_{i} t_{i}
$$

By using Eqs. (48), (50), (54), (55), (56), (60) and (61), we can show that

$$
\begin{equation*}
x_{2 i}=2 t_{i}\left(t_{i}+s_{i}\right)=2 t_{i} z_{i}=4 z_{i} v_{i}=2 z_{i}\left(2 x_{i}-z_{i}+1\right) \tag{62}
\end{equation*}
$$

and

$$
\begin{equation*}
z_{2 i}=t_{i}^{2}+z_{i}^{2}=\left(2 x_{i}-z_{i}+1\right)^{2}+z_{i}^{2} \tag{63}
\end{equation*}
$$

By using Eqs. (49), (50), (51), (52), (60) and (61), we can show that

$$
\begin{equation*}
u_{2 \mathrm{i}}=2 \mathrm{t}_{\mathrm{i}}^{2}=8 \mathrm{v}_{\mathrm{i}}^{2} \tag{64}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathrm{v}_{2 \mathrm{i}}=\mathrm{s}_{\mathrm{i}} \mathrm{t}_{\mathrm{i}}=2 \mathrm{v}_{\mathrm{i}} \mathbf{s}_{\mathrm{i}}=2 \mathrm{v}_{\mathrm{i}}\left(2 \mathrm{u}_{\mathrm{i}}+1\right) \tag{65}
\end{equation*}
$$

By invoking Eqs. (58) and (59), we can show that

$$
\begin{equation*}
u_{2 \mathbf{i}+1}=\left(v_{i}+v_{i+1}\right)^{2}=\left(u_{i+1}-u_{i}\right)^{2} \tag{66}
\end{equation*}
$$

and

$$
\begin{equation*}
v_{2 i+1}=z_{i}\left(v_{i}+v_{i+1}\right) \tag{67}
\end{equation*}
$$

The following equations are also easily derived:

$$
\begin{gather*}
s_{2 i+1}=2 z_{i}^{2}+\left(v_{i}+v_{i+1}\right)^{2}=2 z_{i}^{2}+\left(z_{i}+t_{i}\right)^{2}  \tag{68}\\
t_{2 i+1}=2 z_{i}+\left(v_{i}+v_{i+1}\right)=2 z_{i}\left(z_{i}+t_{i}\right)  \tag{69}\\
x_{2 i+1}=\left(z_{i}+2 x_{i}+1\right)^{2}-z_{i}^{2}  \tag{70}\\
z_{2 i+1}=\left(z_{i}+2 x_{i}+1\right)^{2}+z_{i}^{2} \tag{71}
\end{gather*}
$$

## 12. SUM AND DIFFERENCE RULES

The following rules are either already included among the equations we have derived so far, or are easily derived from them.

$$
\begin{gather*}
s_{i}+t_{i}=z_{i}  \tag{56}\\
s_{i}-t_{i}=z_{i-1},  \tag{72}\\
u_{i}+v_{i}=u_{i+1}-v_{i+1}=\frac{1}{2}\left(z_{i}-1\right),  \tag{73}\\
u_{i}-v_{i}=u_{i-1}+v_{i-1}=\frac{1}{2}\left(z_{i-1}-1\right),  \tag{74}\\
z_{i}+x_{i}=u_{i+1},  \tag{58}\\
z_{i}-x_{i}=u_{i}+1  \tag{47}\\
s_{2 i}+t_{2 i}=t_{i}^{2}+z_{i}^{2},  \tag{75}\\
s_{2 i}-t_{2 i}=t_{i}^{2}+z_{i-1}^{2}  \tag{76}\\
u_{2 i}+v_{2 i}=2 v_{i}\left(v_{i}+v_{i+1}\right),  \tag{77}\\
u_{2 i}-v_{2 i}=2 v_{i}\left(t_{i}-z_{i}\right),  \tag{78}\\
z_{2 i}+x_{2 i}=\left(z_{i}+t_{i}\right)^{2}, \tag{79}
\end{gather*}
$$

$$
\begin{gather*}
z_{2 i}-x_{2 i}=\left(z_{i}-t_{i}\right)^{2}=s_{i}^{2},  \tag{80}\\
s_{2 i+1}+t_{2 i+1}=3\left(t_{i}+z_{i}\right)^{2}+2 t_{i} z_{i}+2, \\
s_{2 i+1}-t_{2 i+1}=z_{2 i}=t_{i}^{2}+z_{i}^{2} \\
u_{2 i+1}+v_{2 i+1}=2 v_{i+1}\left(v_{i}+v_{i+1}\right), \\
u_{2 i+1}-v_{2 i+1}=2 v_{i}\left(v_{i}+v_{i+1}\right), \\
z_{2 i+1}+x_{2 i+1}=2\left(z_{i}+2 x_{i}+1\right)^{2}, \\
z_{2 i+1}-x_{2 i+1}=2 z_{i}^{2}, \\
z_{2 i+1}-\left(x_{2 i+1}+1\right)=\left(u_{i+1}-u_{i}\right)^{2},
\end{gather*}
$$

13. HISTORICAL NOTE

Dickson's History of the Theory of Numbers, Vol. II, contains scattered notes about Eqs. (1) and (2), and denotes a sixty-page chapter to the Pell equation, of which Eq. (3) is a special case. (See [4].) Some of the more interesting facts cited by Dickson are reproduced below.

## Concerning Eq. (1).

Fermat showed that if $(x, z)$ is a solution of Eq. (1), then so is $(3 x+$ $2 z+1,4 x+3 z+2$ ). (See Eqs. (7) and (8).)
C. Hutton (1842) found that if $p_{r} / q_{r}$ is the $r^{\text {th }}$ convergent of the continued fraction for the square root of 2 , then $p_{r} p_{r+1}$ and $2 q_{r} q_{r+1}$ are consecutive integers, and the sum of their squares is equal to $q_{2 r+1}^{2}$.
P. Bachmann (1892) proved that the only integral solutions of $x^{2}+y^{2}=$ $z^{2}, z \geq 0, x$ and $y$ consecutive, are given by

$$
\mathrm{x}+\mathrm{y}+\mathrm{z} \sqrt{2}=(1+\sqrt{2})\left(3+2 \sqrt{2}^{\mathrm{k}}, \quad \mathrm{k}=0,1,2, \cdots\right.
$$

R. W. D. Christie (1897) expressed the solutions of Eq. (1) in terms of continuants. The continuant $C\left(a_{1}, a_{2}, \cdots, a_{r}\right)$ is the $r^{\text {th }}$ order determinant

in which the term $u_{i j}$ of the principal diagonal is equal to $a_{i}$, $(i=1, \cdots, r)$, each term $u_{i+1, i},(i=1, \cdots, r-1)$, immediately under the principal diagonal is equal to -1 , and each term $u_{i-1, i},(i=2, \cdots, r)$, immediately above the principal diagonal, is equal to 1 , and every other term is equal to 0 . Let $Q_{r}$ stand for the $r^{\text {th }}$ order continuant $C(2, \ldots, 2)$ in which all the diagonal elements are 2 , and define $2_{0}=1$. Christie observed that the positive integral solutions of Eq. (1) are given by

$$
\mathrm{x}_{\mathrm{r}}=\mathrm{Q}_{0}+\mathrm{Q}_{1}+\ldots+\mathrm{Q}_{2 \mathrm{r}-1}, \quad \mathrm{z}_{\mathrm{r}}=\mathrm{Q}_{2 \mathrm{r}}, \quad \mathrm{r}=1,2, \cdots
$$

This result was proved by T. Muir (1899-1901).
Concerning Eq. (2).
Euler (1732) found solutions to Eq. (2) in the following way: He started with the identity of Plutarch (about 100 AD ),

$$
\frac{8 u(u+1)}{2}+1=(2 u+1)^{2} .
$$

By Eq. (2),

$$
\frac{u(u+1)}{2}=v^{2}
$$

Then $8 v^{2}+1=(2 u+1)^{2}$. Let $s=2 u+1$, and $t=2 v$. Then $s$ and $t$ satisfy Eq. (3), which Euler solved by using his general method for solving the Pell equation.

Euler proved, too, that $u$ and $v$ satisfy Eq. (2) only when

$$
\mathrm{u}=\frac{\alpha+\beta-2}{4}, \quad \mathrm{v}=\frac{\alpha-\beta}{4 \sqrt{2}}
$$

where

$$
\alpha=\left(3+2 \sqrt{2}^{2}\right)^{\mathrm{n}}, \quad \beta=(3-\sqrt{2})^{\mathrm{n}}, \quad \mathrm{n}=0,1,2, \cdots .
$$

From this result, he derived the recursionformulas given by Eqs. (27) and (28).
E. Lionnet (1881) stated that 0,1 and 6 are the only triangular numbers whose squares are triangular numbers. This assertion was proved by MoretBlanc (1882). In the notation of Section 2, Lionnet's result is that $\mathrm{S}(\mathrm{T}(\mathrm{n})$ ) = $T(\mathrm{~m})$ only if $\mathrm{n}=0,1$ or 3 . Since $\mathrm{S}(\mathrm{T}(0))=0=\mathrm{T}(0), \quad \mathrm{S}(\mathrm{T}(1))=1=\mathrm{T}(1)$, and $\mathrm{S}(\mathrm{T}(3))=36=\mathrm{T}(8)$, it follows from Lionnet's result that the equation $\mathrm{S}(\mathrm{T}(\mathrm{n}))=\mathrm{T}(\mathrm{S}(\mathrm{n}))$ has only the trivial solutions $(0,0)$ and $(1,1)$.

Concerning Eq. (3).
Among those who worked on solving equations of the form $S^{2}-d t^{2}=1$ were Diophantus (about 250 AD ), and Brahmegupta (born 598 AD ).

The general problem of solving all equations of this form was proposed by Fermat in February 1657. Hence an equation of this form should be called a Fermat equation. It came to be known as the Pell equation as a result of an error by Euler, who incorrectly attributed to Pell the method of solution given in Wallis' Opera.

Lagrange gave the first proof that every Pell equation has integral solutions with $t \neq 0$ if $d$ is not a square.

Others who contributed to the voluminous literature on this equation are Legendre, Dirichlet and Gauss.
