## THE LAMBERT FUNCTION

WRAY G. BRADY
Slippery Rock State College, Slippery Rock, Pennsylvania

The sum of certain reciprocal Fibonacci series can be summed in terms of the so-called Lambert series or Lambert function:

$$
L(z)=\sum_{n=1}^{\infty} \frac{z^{n}}{1-z^{n}}=\sum_{n=1}^{\infty} T_{n}(z)^{n}
$$

where $T_{n}$ is the number of divisors of $N^{*}$. For example, let

$$
\begin{gathered}
\beta=\frac{1-\sqrt{5}}{2} \\
\sum_{\mathrm{k}=1}^{\infty} \frac{1}{\mathrm{~F}_{2 \mathrm{k}}}=\sqrt{5}\left[\mathrm{~L}\left(\frac{3-\sqrt{5}}{2}\right)-\mathrm{L}\left(\frac{7-3 \sqrt{5}}{2}\right)\right]=\sqrt{5}\left[\mathrm{~L}\left(\beta^{2}\right)-\mathrm{L}\left(\beta^{4}\right)\right]
\end{gathered}
$$

or to generalize:

$$
\sum_{\mathrm{k}=1}^{\infty} \frac{1}{\mathrm{~F}_{2 \mathrm{~km}}}=\sqrt{5}[\mathrm{~L}(2 \mathrm{~m} \beta)-\mathrm{L}(4 \mathrm{~m} \beta)]
$$

for an integer $m$, such that $m>0$.
In this note, we tabulate the Lambert function for selected real values of z . The results are given in the table below. The calculations were made by machine evaluation. The graph of the approximation polynomial to $L(z)$ is shown on the following page.

[^0]THE LAMBERT FUNCTION
