## Define a sequence of generalized Fibonacci numbers

(1)

$$
\left\{\mathrm{w}_{\mathrm{n}}\right\}_{0}^{\infty}=\left\{\mathrm{w}_{\mathrm{n}}(\mathrm{~b}, \mathrm{c} ; \mathrm{P}, \mathrm{Q})\right\}_{0}^{\infty}
$$

by

$$
\begin{equation*}
w_{n}=b w_{n-1}+c w_{n-2}, \tag{2}
\end{equation*}
$$

where n denotes an integer $\geq 2, \mathrm{w}_{0}=\mathrm{P}$ and $\mathrm{w}_{1}=\mathrm{Q}$. Considering a special form of this sequence

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(1)}\right\}_{0}^{\infty}=\left\{\mathrm{w}_{\mathrm{n}}(1,1 ; 0,1)\right\}_{0}^{\infty}
$$

D. D. Wall [1] has shown that

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(1)}(\bmod \mathrm{m})\right\}_{0}^{\infty}
$$

(where $m$ denotes a positive integer) is simply periodic. Our objective is to point out a rigorous proof of the same and extend it to the sequence of Tribonacci numbers

$$
\begin{equation*}
\left\{\mathrm{T}_{\mathrm{n}}\right\}_{0}^{\infty}=\left\{\mathrm{T}_{\mathrm{n}}(\mathrm{~b}, \mathrm{c}, \mathrm{~d} ; \mathrm{P}, \mathrm{Q}, \mathrm{R})\right\}_{0}^{\infty} \tag{3}
\end{equation*}
$$

This sequence of numbers is defined by

$$
\begin{equation*}
T_{n}=b T_{n-1}+c T_{n-2}+d T_{n-3}, \tag{4}
\end{equation*}
$$

where n denotes an integer $\geq 3, \mathrm{~T}_{0}=\mathrm{P}, \mathrm{T}_{1}=\mathrm{Q}$ and $\mathrm{T}_{2}=\mathrm{R}$.
Theorem a.

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(1)}(\bmod \mathrm{m})\right\}_{0}^{\infty}
$$

is simply periodic.

Proof. Let

$$
m=\Pi p_{j}^{a_{j}}
$$

where $j=1,2, \cdots$, $i$ and $p_{j}$ represents a prime. Since

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(1)}\left(\bmod \mathrm{p}_{\mathrm{j}}^{\mathrm{j}}\right\}_{0}^{\infty}\right.
$$

is known to be periodic [1], we denote the length of the period

$$
\left\{w_{n}^{(1)}\left(\bmod p_{j}^{\mathrm{a}_{\mathrm{j}}}\right\}_{0}^{\infty}\right.
$$

by $\mathrm{k}_{\mathrm{j}}$ and write
(5)

$$
\mathrm{w}_{\mathrm{k}_{\mathrm{j}}}^{(1)} \equiv 0\left(\bmod \mathrm{p}_{\mathrm{j}}^{\mathrm{a}_{\mathrm{j}}}\right), \quad \mathrm{w}_{\mathrm{k}_{\mathrm{j}}+1}^{(1)} \equiv 1\left(\bmod \mathrm{p}_{\mathrm{j}}^{\mathrm{a}^{\mathrm{j}}}\right) .
$$

Then it is easy to show that

$$
\begin{aligned}
& \mathrm{w}_{\mathrm{k}_{1} k_{2} \cdots \mathrm{k}_{\mathrm{i}}}^{(1)} \equiv 0\left(\bmod \mathrm{p}_{1}^{a_{1}}\right), \quad \mathrm{w}_{\mathrm{k}_{1} \mathrm{k}_{2} \cdots \mathrm{k}_{\mathrm{i}}}^{(1)} \equiv 0\left(\bmod \mathrm{p}_{2}^{a_{2}}\right), \cdots, \\
& \mathrm{w}_{\mathrm{k}_{1} k_{2} \cdots k_{i}}^{(1)} \equiv 0\left(\bmod \mathrm{p}_{\mathrm{i}}\right)
\end{aligned}
$$

(6) and

$$
\begin{gathered}
\mathrm{w}_{\mathrm{k}_{1} k_{2} \cdots k_{i}+1}^{(1)} \equiv 1\left(\bmod \mathrm{p}_{1}^{a_{1}}\right), \quad \mathrm{w}_{\mathrm{k}_{1} k_{2} \cdots k_{i}+1}^{(1)} \equiv 1\left(\bmod \mathrm{p}_{2}^{a_{2}}\right), \cdots, \\
\mathrm{w}_{\mathrm{k}_{1} k_{2} \cdots k_{i}+1}^{(1)} \equiv 1\left(\bmod \mathrm{p}_{\frac{1}{2}}^{\mathrm{i}}\right)
\end{gathered}
$$

Therefore, it follows that

$$
\mathrm{w}_{\mathrm{k}_{1} \mathrm{k}_{2} \cdots \mathrm{k}_{\mathrm{i}}}^{(1)} \equiv 0(\bmod \mathrm{~m})
$$

(7)
and

$$
\mathrm{w}_{\mathrm{k}_{1} \mathrm{k}_{2} \cdots \mathrm{k}_{\mathrm{i}}+1}^{(1)} \equiv 1(\bmod \mathrm{~m})
$$

and

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(1)}(\bmod \mathrm{m})\right\}_{0}^{\infty}
$$

becomes simply periodic.

Theorem b. If $(b, c, P, Q, m)=1$, then $\left\{w_{n}(\bmod m)\right\}_{0}^{\infty}$ is simply periodic. Proof. Let

$$
\left\{\mathrm{w}_{\mathrm{n}}^{(2)}\right\}_{0}^{\infty}=\left\{\mathrm{w}_{\mathrm{n}}(\mathrm{~b}, \mathrm{c} ; 0,1)\right\}_{0}^{\infty}
$$

For p denoting a prime, if $(\mathrm{b}, \mathrm{c}, \mathrm{p})=1$, then ithas been shown in [3], that $\left\{\mathrm{w}_{\mathrm{n}}^{(2)}(\bmod \mathrm{p})\right\}_{0}^{\infty}$ is simply periodic. Also, since

$$
\mathrm{w}_{\mathrm{n}}=\mathrm{pw}_{\mathrm{n}}^{(2)}+\mathrm{cQw}_{\mathrm{n}-1}^{(2)},
$$

it follows that if $(b, c, P, Q, p)=1$, then $\left\{w_{n_{n}}(\bmod p)\right\}_{0}^{\infty}$ is simply periodic, and the technique of Theorem a renders that $\left\{\mathrm{w}_{\mathrm{n}}(\bmod \mathrm{m})\right\}_{0}^{\infty}$ is simply periodic.

Theorem c. Let

Then

$$
\left\{\mathrm{T}_{\mathrm{n}}^{(9)}\right\}_{0}^{\infty}=\left\{\mathrm{T}_{\mathrm{n}}(1,1,1 ; 0,0,1)\right\}_{0}^{\infty}
$$

$$
\left\{\mathrm{T}_{\mathrm{n}}^{(9)}(\bmod \mathrm{m})\right\}_{0}^{\infty}
$$

is simply periodic.
Proof. We have shown in [2], that $\left\{\mathrm{T}_{\mathrm{n}}^{(9)}(\bmod \mathrm{p})\right\}_{0}^{\infty}$ is simply periodic and the proof that $\left.\overline{\left\{\mathrm{T}_{\mathrm{n}}^{(9)}\right.}(\bmod \mathrm{m})\right\}_{0}^{\infty}$ is simply periodic follows from the technique of Theorem a.

Theorem d. If $(b, c, d, P, Q, R, m)=1$, then $\left\{T_{n}(\bmod m)\right\}_{0}^{\infty}$ is simply periodic.
The proof of this theorem is similar to that of Theorem $c$ and is left to the reader.

## ACKNOWLEDGEMENT

I am grateful to Dr. Joseph Arkin for drawing my attention to the problem of this note in connection with an earlier paper.
