ELEMENTARY PROBLEMS AND SOLUTIONS

Edited by
A. P. Hillman

Please send all material for ELEMENTARY PROBLEMS AND SOLUTIONS to Dr. A. P. HILLMAN; 709 SOLANO DR., S.E.; ALBUQUERQUE, NM 87108.

Each solution should be on a separate sheet (or sheets) and must be received within six months of publication of the problem. Solutions typed in the format used below will be given preference. Proposers of problems should include solutions.

Anyone desiring acknowledgment of contributions should enclose a stamped, self-addressed card (or envelope).

BASIC FORMULAS

The Fibonacci numbers $F_n$ and the Lucas numbers $L_n$, satisfy

\[ F_{n+2} = F_{n+1} + F_n, \quad F_0 = 0, \quad F_1 = 1; \]
\[ L_{n+2} = L_{n+1} + L_n, \quad L_0 = 2, \quad L_1 = 1. \]

Also, $a = (1 + \sqrt{5})/2$, $b = (1 - \sqrt{5})/2$, $F_n = (a^n - b^n)/\sqrt{5}$, and $L_n = a^n + b^n$.

PROBLEMS PROPOSED IN THIS ISSUE

B-664 Proposed by Mohammad K. Azarian, U. of Evansville, Evansville, IN

Let $a_0 = \sqrt{2}$ and $a_{n+1} = \sqrt{2 + a_n}$ for $n$ in \( \{0, 1, \ldots \} \). Show that

\[ \lim_{n \to \infty} a_n = \sum_{k=0}^{n} \left[ \sum_{j=0}^{k} \left( \frac{e}{2} \right)^j \right]^{-1}. \]

B-665 Proposed by Christopher C. Street, Morris Plains, NJ

Show that $AB = 9$, where

\[ A = (19 + 3\sqrt{33})^{1/3} + (19 - 3\sqrt{33})^{1/3} + 1, \]
\[ B = (17 + 3\sqrt{33})^{1/3} + (17 - 3\sqrt{33})^{1/3} - 1. \]

B-666 Taken from solutions to B-643 by Russell Jay Hendel, Dowling College, Oakdale, NY, and by Lawrence Somer, Washington, D.C.

For primes $p$, prove that

\[ \left( \frac{p}{n} \right) \equiv [n/p] \pmod{p}, \]

where $[x]$ is the greatest integer in $x$.

B-667 Proposed by Herta T. Freitag, Roanoke, VA

Let $p$ be a prime, $p \neq 2$, $p \neq 5$, and $m$ be the least positive integer such that $10^m \equiv 1 \pmod{p}$. Prove that each $m$-digit (integral) multiple of $p$ remains a multiple of $p$ when its digits are permuted cyclically.
Let \( h \) be the positive integer whose base 9 numeral

\[
100101102 \ldots 887888
\]

is obtained by placing all the 3-digit base 9 numerals end-to-end as indicated.

(a) What is the remainder when \( h \) is divided by the base 9 integer 14?

(b) What is the remainder when \( h \) is divided by the base 9 integer 81?

B-669  Proposed by Gregory Wulczyn, Lewisburg, PA

Do the equations

\[
\begin{align*}
25F_{a+b} + cF_{b+c} & = 4 - L_{2a}^2 - L_{2b}^2, \\
L_{a+b} + cF_{c+a} - aF_{a+b} - cF_{c-a} - bF_{b+c} & = -4 + L_{2a}^2 + L_{2b}^2 + L_{2c}^2
\end{align*}
\]

hold for all even integers \( a, b, c? \)

**SOLUTIONS**

**Circulant Determinant for \( F_{n+1} \)**

B-640  Proposed by Russell Euler, Northwest Missouri State U., Marysville, MO

Find the determinant of the \( n \times n \) matrix \( (x_{ij}) \) with \( x_{ij} = 1 \) for \( j = i \) and for \( j = i - 1, x_{ij} = -1 \) for \( j = i + 1, \) and \( x_{ij} = 0, \) otherwise.

Solution by Paul S. Bruckman, Edmonds, WA

Let \( A_n \) denote the given matrix and \( D_n \) its determinant. Clearly, \( D_1 = 1, \) and \( D_2 = 2. \) We may expand \( D_n \) along its first row; doing so, we see that \( D_n = D_{n-1} + 4 \) \( B_{n-1}, \) where \( B_n \) is the determinant of the \( n \times n \) matrix obtained by replacing \( x_{21} = 1 \) by 0 in \( A_n, \) all other entries unchanged. Expanding \( B_{n-1} \) along its first column, we see that \( B_{n-1} = D_{n-2}. \) Therefore, we obtain the recurrence relation:

\[
D_n = D_{n-1} + D_{n-2}, \quad n = 3, 4, \ldots .
\]

Together with the initial values of \( D_n, \) we see that

\[
D_n = \Phi_{n+1} (n = 1, 2, \ldots).
\]

Also solved by R. André-Jeannin, C. Ashbacher, Piero Filipponi, Russell Jay Hendel, Hans Kappus, L. Kuipers, Y. H. Harris Kwong, Carl Libis, Alex Necochea, Bob Prielipp, H.-J. Seiffert, Sahib Singh, and the proposer.

**\( F_{mn} \) and \( L_{mn} \) as Polynomials in \( F_m \) and \( L_m \)**

B-641  Proposed by Dario Castellanos, U. de Carabobo, Valencia, Venezuela

Prove that

\[
\begin{align*}
F_{mn} &= \frac{1}{\sqrt{5}} \left[ \left( \frac{L_m + \sqrt{5}P_m}{2} \right)^n - \left( \frac{L_m - \sqrt{5}P_m}{2} \right)^n \right], \\
L_{mn} &= \left( \frac{L_m + \sqrt{5}P_m}{2} \right)^n + \left( \frac{L_m - \sqrt{5}P_m}{2} \right)^n.
\end{align*}
\]

1990] 183
Solution by Y. H. Harris Kwong, SUNY College at Fredonia, NY

Let \( \alpha = (1 + \sqrt{5})/2 \) and \( \beta = (1 - \sqrt{5})/2 \). It is known that
\[
L_m = \alpha^m + \beta^m \quad \text{and} \quad \sqrt{5}F_m = \alpha^m - \beta^m.
\]
Solving for \( \alpha^m \) and \( \beta^m \), we have
\[
\alpha^m = \frac{L_m + \sqrt{5}F_m}{2} \quad \text{and} \quad \beta^m = \frac{L_m - \sqrt{5}F_m}{2}.
\]
Therefore,
\[
P_m = \frac{1}{\sqrt{5}}[\alpha^m - \beta^m] = \frac{1}{\sqrt{5}} \left[ \left( \frac{L_m + \sqrt{5}F_m}{2} \right)^n - \left( \frac{L_m - \sqrt{5}F_m}{2} \right)^n \right],
\]
\[
L_m = \alpha^m + \beta^m = \left( \frac{L_m + \sqrt{5}F_m}{2} \right)^n + \left( \frac{L_m - \sqrt{5}F_m}{2} \right)^n.
\]

Editor's note: The proposer asked for a proof that
\[
P_m = \frac{1}{\sqrt{5}} \left[ \left( \frac{L_m + \sqrt{5}F_m}{2} \right)^n - \left( \frac{L_m - \sqrt{5}F_m}{2} \right)^n \right]
\]
and
\[
L_m = \left( \frac{L_m + \sqrt{5}F_m}{2} \right)^n + \left( \frac{L_m - \sqrt{5}F_m}{2} \right)^n
\]
and the Elementary Problems editor inadvertently interchanged some (but not all) \( m \)'s and \( n \)'s.

\( L_{k(2n+1)} \) as a Polynomial in \( L_{2n+1} \)

B–642 Proposed by Piero Filipponi, Fond. U. Bordoni, Rome, Italy

It is known that
\[
L_{2(2n+1)} = L_{2n+1}^2 + 2,
\]
and it can readily be proven that
\[
L_{3(2n+1)} = L_{2n+1}^3 + 3L_{2n+1}.
\]
Generalize these identities by expressing \( L_{k(2n+1)} \), for integers \( k \geq 2 \), as a polynomial in \( L_{2n+1} \).

Solution by H.-J. Seiffert, Berlin, Germany

Define the Pell-Lucas polynomials \( Q_k(x) \) as in [1], p. 7, (1.2), by
\[
Q_0(x) = 2, \quad Q_1(x) = 2x, \quad Q_{k+2}(x) = 2xQ_{k+1}(x) + Q_k(x).
\]
First, we show that
\[
Q_k(L_{2n+1}/2) = L_{k(2n+1)}
\]
is true for \( k = 0, 1 \). Assuming (1) holds for all \( j = 0, \ldots, k \), we get
\[
Q_{k+1}(L_{2n+1}/2) = L_{2n+1}Q_k(L_{2n+1}/2) + Q_{k-1}(L_{2n+1}/2)
\]
\[
= L_{2n+1}L_{k(2n+1)} + L_{(k-1)(2n+1)} = L_{(k+1)(2n+1)},
\]

[May}
where the last equality can easily be proven by using the known Binet form of the Lucas numbers. Thus (1) is established by induction on \( k \). In [1], p. 9, (2.16), it is shown that, for \( k > 0 \),

\[
q_k(x) = \sum_{j=0}^{[k/2]} \frac{k}{k-j} \binom{k-j}{j} (2x)^{k-2j},
\]

where \([ \ ]\) denotes the greatest integer function. From (1) and (2), we obtain

\[
L_k(2n+1) = \sum_{j=0}^{[k/2]} \frac{k}{k-j} \binom{k-j}{j} L_{2n+1}^{k-2j}.
\]

Also solved by R. André-Jeannin, Paul S. Bruckman, Herta T. Freitag, Russell Jay Hendel, L. Kuipers, Y. H. Harris Kwong, Sahib Singh, Paul Smith, and the proposer.

**Binomial Coefficient Congruence**

**B-643** Proposed by T. V. Padnakumar, Trivandrum, South India

For positive integers \( a, n \), and \( p \), with \( p \) prime, prove that

\[
\binom{n + ap}{p} - \binom{n}{p} \equiv a \pmod{p}.
\]

Solution by Y. H. Harris Kwong, SUNY College at Fredonia, NY

A well known result of E. Lucas [2] states that if the \( p \)-ary expansions of \( n \) and \( k \) are \( \sum_{i \geq 0} a_i p^i \) and \( \sum_{i \geq 0} k_i p^i \), respectively, then

\[
\binom{n}{k} \equiv \prod_{i \geq 0} \binom{n_i}{k_i} \pmod{p}.
\]

(For a short and simple proof, consult [1].) Suppose the \( p \)-ary expansions of \( a \) and \( m = n + ap \) are \( \sum_{i \geq 0} a_i p^i \) and \( \sum_{i \geq 0} m_i p^i \), respectively. We have to show that

\[
\binom{m}{p} - \binom{n}{p} \equiv \binom{m_1}{1} - \binom{n_1}{1} = m_1 - n_1 \equiv a \equiv a_0 \pmod{p}.
\]

But it is clear from \( m = n + ap \) that \( m_1 \equiv n_1 + a_0 \pmod{p} \), so the proof is completed.

Also solved by R. André-Jeannin, Paul S. Bruckman, Piero Filipponi, Russell Jay Hendel, Joseph J. Kostal & Subramanyam Durbha, L. Kuipers, Bob Prielipp, Lawrence Somer, and the proposer.

**Markov Chain**

**B-644** Proposed by H. W. Corley, U. of Texas at Arlington, TX

Consider three children playing catch as follows. They stand at the vertices of an equilateral triangle, each facing its center. When any child has the ball, it is thrown to the child on her or his left with probability \( 1/3 \) and to
the child on the right with probability $2/3$. Show that the probability that
the initial holder has the ball after $n$ tosses is

$$\frac{2\sqrt{3}}{3} \cos \left( \frac{3\pi n}{6} \right) + \frac{1}{3} \quad \text{for } n = 0, 1, 2, \ldots$$

**Solution** by Hans Kappus, Rodersdorf, Switzerland

More generally, let us assign probabilities $p$, $q$ ($p + q = 1$) for throws to
the left and right, respectively. Denote by $p_i(n)$ the probability that child $i$ has
the ball after $n$ tosses ($i = 1, 2, 3$) and suppose that child 1 is the
initial holder, i.e., impose the initial conditions

(1) $p_1(0) = 1$, $p_1(1) = 0$.

Applying the rule of conditional probability and noting that

$$p_1(n) + p_2(n) + p_3(n) = 1,$$

we have the recursion

(2) \[
\begin{align*}
p_1(n + 1) &= q \cdot p_2(n) + p \cdot p_3(n) = -p \cdot p_1(n) + (q - p) \cdot p_2(n) + p \\
0_2(n + 1) &= p \cdot p_1(n) + q \cdot p_3(n) = (p - q) \cdot p_1(n) - q \cdot p_2(n) + q \\
0_3(n + 1) &= p \cdot p_1(n) + q \cdot p_2(n) = (p - q) \cdot p_1(n) - q \cdot p_2(n) + q
\end{align*}
\]

Eliminating $p_2(n)$ we arrive at the inhomogeneous second-order difference equation

(3) $p_1(n + 2) + p_1(n + 1) + (1 - 3pq) \cdot p_1(n) = 1 - pq$,

which may be solved by standard methods. The solution turns out to be

(4) $p_1(n) = \frac{2}{3} \cdot (1 - 3pq)^{n/2} \cos n\phi + \frac{1}{3}$,

where $\phi$ is given by

(5) $\cos \phi = -\frac{1}{2} \cdot (1 - 3pq)^{-1/2}$, $\sin \phi = \frac{1}{2\sqrt{1 - 3pq}}^{1/2}$.

For the special case $p = 1/3$, $q = 2/3$; this is the result of the proposer.

**Remark:** The process described in the problem is a Markov chain with transition matrix

$$P = \begin{bmatrix} 0 & p & q \\ q & 0 & p \\ p & q & 0 \end{bmatrix}.$$

Also solved by Paul S. Bruckman, Piero Filipponi, and the proposer.
