# ELEMENTARY PROBLEMS AND SOLUTIONS 

Edited by A.P. HILLMAN<br>University of Santa Clara, Santa Clara, California

Send all communications regarding Elementary Problems and Solutions to Professor A. P. Hillman, Mathematics Department, University of Santa Clara, Santa Clara, California. Any problem believed to be new in the area of recurrent sequences and any new approaches to existing problems will be welcomed. The proposer should submit each problem with solution in legible form, preferably typed in double spacing with name and address of the proposer as a heading.

Solutions to problems listed below should be submitted on separate signed sheets within two months of publication.

B-58 Proposed by Sidney Kravitz, Dover, New Jersey
Show that no Fibonacci number other than 1,2 , or 3 is equal to a Lucas number.

B-59 Proposed by Brother U. Alfred, St. Mary's College, California
Show that the volume of a truncated right circular cone of slant height $F_{n}$ with $F_{n-1}$ and $F_{n+1}$ the diameters of the bases is

$$
\sqrt{3} \pi\left(F_{n+1}^{3}-F_{n-1}^{3}\right) / 24
$$

B-60 Proposed by Verner E. Hoggatt, Jr., San Jose State College, San Jose, California
Show that $L_{2 n} L_{2 n+2}-5 F_{2 n+1}^{2}=1$, where $F_{n}$ and $L_{n}$ are the n-th Fibonacci number and Lucas number,respectively.

B-61 Proposed by J.A.H. Hunter, Toronto, Ontario
Define a sequence $U_{1}, U_{2}, \ldots$ by $U_{1}=3$ and

$$
U_{n}=U_{n-1}+n^{2}+n+1 \text { for } n>1
$$

Prove that $U_{n} \equiv 0(\bmod n)$ if $n \neq 0(\bmod 3)$.
B-62 Proposed by Brother U. Alfred, St. Mary's College, California
Prove that a Fibonacci number with odd subscript cannot be represented as the sum of squares of two Fibonacci numbers in more than one way.

B-63 An old problem whose source is unknown, suggested by Sidney Kravitz, Dover, New Jersey

In $\triangle A B C$ let sides $A B$ and $A C$ be equal. Let there be a point $D$ on side $A B$ such that $A D=C D=B C$. Show that

$$
2 \cos \Varangle \mathrm{~A}=\mathrm{AB} / \mathrm{BC}=(1+\sqrt{5}) / 2,
$$

the golden mean.

## SOLUTIONS

## A BOUND ON BOUNDED FIBONACCI NUMBERS

B-44 Proposed by Douglas Lind, Falls Cburch, Virginia
Prove that for every positive integer $k$ there are no more than n Fibonacci numbers between $\mathrm{n}^{\mathrm{k}}$ and $\mathrm{n}^{\mathrm{k}+1}$.

Solution by the proposer.
Assume the maximum,
(1)

$$
\mathrm{n}^{\mathrm{k}}<\mathrm{F}_{\mathrm{r}+1}, \mathrm{~F}_{\mathrm{r}+2}, \ldots, \mathrm{~F}_{\mathrm{r}+\mathrm{n}}<\mathrm{n}^{\mathrm{k}+1} .
$$

Now

$$
\begin{aligned}
\sum_{j=1}^{n-1} F_{r+j} & =\sum_{j=1}^{r+n-1} F_{j}-\sum_{j=1}^{r} F_{j} \\
& =F_{r+n+1}-F_{r+2} .
\end{aligned}
$$

But by (1),

$$
\sum_{j=1}^{n-1} F_{r+j}+F_{r+2}>n \cdot n^{k}
$$

and hence

$$
\mathrm{F}_{\mathrm{r}+\mathrm{n}+1}>\mathrm{n}^{\mathrm{k}+1},
$$

thus proving the proposition.

## ANOTHER SUM

B-45 Proposed by Cbarles R. Wall, Texas Cbristian University, Ft. Worth, Texas
Let $H_{n}$ be the $n$-th generalized Fibonacci number, i. e., let $\mathrm{H}_{1}$ and $\mathrm{H}_{2}$ be arbitrary and $\mathrm{H}_{\mathrm{n}+2}=\mathrm{H}_{\mathrm{n}+1}+\mathrm{H}_{\mathrm{n}}$ for $\mathrm{n}>0$. Show that $\mathrm{nH}_{1}+(\mathrm{n}-1) \mathrm{H}_{2}+(\mathrm{n}-2) \mathrm{H}_{3}+\ldots+\mathrm{H}_{\mathrm{n}}=\mathrm{H}_{\mathrm{n}+4}-(\mathrm{n}+2) \mathrm{H}_{2}-\mathrm{H}_{1}$ 。

Solution by David Zeitlin, Minneapolis, Minnesota.
In B-20 (see Fibonacci Quarterly, 2(1964) p. 77), it was shown that

$$
\sum_{j=1}^{n} H_{j}=H_{n+2}-H_{2}
$$

In B-40 (see Fibonacci Quarterly, 2(1964), p. 155), Wall proposed that
n

$$
\sum_{j=1} j H_{j}=(n+1) H_{n+2}-H_{n+4}+H_{1}+H_{2}
$$

Thus, the desired sum

$$
\begin{aligned}
\sum_{j=1}^{n}[(n+1)-j] H_{j} & =(n+1) \sum_{j=1}^{n} H_{j}-\sum_{j=1}^{n} \mathrm{NH}_{j} \\
& =\left[(n+1) H_{n+2}-(n+1) H_{2}\right]-\left[(n+1) H_{n+2}-H_{n+4}+H_{1}+H_{2}\right] \\
& =H_{n+4}-(n+2) H_{2}-H_{1} .
\end{aligned}
$$

Also solved by Douglas Lind, Kenneth E. Newcomer, Farid K. Sbuayto, Sheryl B. Tadlock, Howard L. Walton, Charles Zeigenfus, and the proposer.

## A CONTINUANT DETERMINANT

B-46 Proposed by C.A. Church, Jr., Duke University, Durbam, North Carolina
Evaluate the $n$-th order determinant

$$
D_{n}=\left|\begin{array}{ccccc}
a+b & a b & 0 & 0 & \cdots \\
1 & a+b & a b & 0 & \cdots \\
0 & 1 & a+b & a b & \cdots \cdot \\
0 & 0 & 1 & a+b & \cdots \\
\ldots & & & & \\
\ldots & & & &
\end{array}\right|
$$

Solution by F.D. Parker, SUNY, Buffalo, N.Y.
We denote the value of the determinant of order $n$ by $D(n)$, and notice that $D(1)=a+b$ and $D(2)=a^{2}+a b+b^{2}$. Expanding $D(n)$ by the first row, we see that

$$
D(n)=(a+b) D(n-1)-a b D(n-2)
$$

This is a homogeneous linear second order difference equation; if $a \neq b$, the solution which fits the initial conditions is

$$
D(n)=\left(a^{n+1}-b^{n+1}\right) /(a-b)
$$

If $a=b$, the solution which fits the initial conditions is $D(n)=(1+n) a^{n}$. Also solved by Joel L. Brenner, Douglas Lind, C.B.A. Peck, David Zeitlin, and the proposer.

Lind, Peck, and Zeitlin pointed out that B-46 is a special case of B-13. Peck also noted that B-46 is an example of a class of continuants mentioned by J. J. Sylvester in the Philosophical Magazine, Series 4, 5 (1853)446-457. (See T. Muir, History of the Theory of Determinants (Dover) Vol. I, p. 418.) Brenner noted that B-46 and similar problems occur as Nos. 217, 225, 234, etc. in Faddeev and Sominski, Problems in Higher Algebra, a translation of which will soon be published by W. H. Freeman.

## CONSECUTIVE COMPOSITE FIBONACCI NUMBERS

## B-47 Proposed by Barry Litvack, University of Michigan, Ann Arbor, Michigan

Prove that for everypositive integer $k$ thereare $k$ consecutive Fibonacci numbers each of which is composite.

## Solution by Sidney Kravitz, Dover, New Jersey

Let $F_{n}$ be the $n$-th Fibonacci number. We note that $F_{n}>1$ for $n>2$, that $F_{j}$ divides $F_{m j}$ and that $j$ is adivisor of $(k+2)!+j$ for $3 \leq j \leq k+2$. Thus the $k$ consecutive Fibonacci numbers

$$
F_{(k+2)!}+3, F_{(k+2)!}+4, \cdots, F_{(k+2)!}+k+2
$$

are divisible by $F_{3}, F_{4}, \ldots, F_{k+2}$ respectively.

Also solved by R.W. Castown, Douglas Lind, F.D. Parker, and the proposer.

## A BINOMIAL EXPANSION

B-48 Proposed by H.H. Ferns, University of Victoria, Victoria, Britisb Columbia, Canada Prove that
$\sum_{\mathrm{k}=1}^{\mathrm{r}-1}(-2)^{\mathrm{k}}(\underset{\mathrm{k}}{\mathrm{r}}) \mathrm{F}_{\mathrm{k}}=\left\{\begin{array}{l}-2^{\mathrm{r}} \mathrm{F}_{\mathrm{r}} \text { if } \mathrm{r} \text { is an even positive integer } \\ 2^{\mathrm{r}} \mathrm{F}_{\mathrm{r}}-2(5)^{(\mathrm{r}-1) / 2} \text { if } \mathrm{r} \text { is an odd positive integer, }\end{array}\right.$ where $F_{n+2}=F_{n+1}+F_{n}\left(F_{1}=F_{2}=1\right)$ and find the corresponding sum in which the $\mathrm{F}_{\mathrm{k}}$ are replaced by the Lucas numbers $\mathrm{L}_{\mathrm{k}}$.
Solution by D.G. Mead, University of Santa Clara, Santa Clara, California
Let $S$ be the given sum. By the Binet formula,

$$
F_{n}=\left(a^{n}-b^{n}\right) /(a-b)
$$

where $\mathrm{a}=(1+\sqrt{5}) / 2$ and $\mathrm{b}=1-\mathrm{a}$. Then $\mathrm{a}-\mathrm{b}=\sqrt{5}=1-2 \mathrm{a}=2 \mathrm{~b}-1$, and

$$
\begin{aligned}
S+(-2)^{r} F_{r} & =\sum_{k=0}^{r}\binom{r}{k}(-2)^{k} F_{k} \\
& =\frac{1}{\sqrt{5}} \sum_{k=0}^{r}\left(\frac{r}{k}\right)\left[(-2 a)^{k}-(-2 b)^{k}\right] \\
& =\frac{(1-2 a)^{r}-(1-2 b)^{r}}{\sqrt{5}} \\
& =\frac{(\sqrt{5})^{r}\left[1-(-1)^{r}\right]}{\sqrt{5}}
\end{aligned}
$$

The desired conclusion follows immediately.
Similarly one sees from $L_{n}=a^{n}+b^{n}$ that the corresponding sum for the Lucas numbers is $-2-2^{r} L_{r}+2(\sqrt{5})^{r}$ for $r$ even and $-2+2^{r} L_{r}$ for $r$ odd.

## AN ALPHAMETIC

B-49 Proposed by Anton Glaser, Pennsylvania State University, Abington, Pennsylvania

Let $\phi$ represent the letter "oh'.
Given that $T, W, \phi, L, V, P$, and $T W \phi$ are Fibonacci numbers, solve the cryptarithm in the base 14, introducing the digits $a, \beta, \gamma$, and $\delta$ in base 14 for 10 , II, 12, and 13 in base 10.

TW $\phi$
IS
THE
$\phi N L Y$
EVEN
$\overline{\text { PRIME }}$

Solution by Charles Ziegenfus, Madison College, Harrisonburg, Virginia
With a little calculation one observes that the Fibonacci number corresponding to $\mathrm{TW} \phi$ is 2584. Thus, $\mathrm{T}=\delta, \mathrm{W}=2, \phi=8, \mathrm{P}=1$, $L=3$ or 5 , and $V=3$ or 5 . Next we note that $8+E+(2$ or 3$)=1 R$, so that $E=4+R$ or $E=3+R$ 。 Tabulating these results:

| R | 0 | 6 | 7 | 4 | 6 | 7 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E | 4 | $\alpha$ | $\beta$ | 7 | 9 | $a$ | $\gamma$ |

Further, $8+S+E+Y+N=k E$ or $S+Y+N=k 0-8=6$, 16 , or 26 in base 14. There are no possible choices for $\mathrm{S}, \mathrm{Y}, \mathrm{N}$ such that $S+Y+N=6$ or 26. Thus $S, Y$, $N$ can be chosen from $\{0,9, \beta\}$; $\{4,7,9\} ;\{4,6, a\}$ 。 Tabulating this with the previous result we obtain:

| R | 6 | 7 | 4 | 7 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| E | $a$ | $\beta$ | 7 | $a$ | $\gamma$ |
| $\mathrm{~S}, \mathrm{Y}, \mathrm{N}$ | $4,7,9$ <br> or <br> $0, ~ 9, ~$ | $4,6, a$ | $0,9, \beta$ | $0,9, \beta$ | $4,6, a$ |

Further,

$$
\begin{aligned}
\mathrm{T}+\mathrm{W}+\phi & +\mathrm{I}+\mathrm{S}+\mathrm{T}+\mathrm{H}+\mathrm{E}+\phi+\mathrm{N}+\mathrm{L}+\mathrm{Y}+\mathrm{E}+\mathrm{V}+\mathrm{E}+\mathrm{N} \\
& -\mathrm{P}-\mathrm{R}-\mathrm{I}-\mathrm{M}-\mathrm{E} \text { is a multiple of } \delta .
\end{aligned}
$$

We reduce the above to $6+\left(2^{\circ} E-R\right)+H+N-M=\delta \cdot k_{0}$
On substituting the possible values for $R$ and $E$ we further reduce this problem to the following cases:
a. $R=6$ and $E=a, \quad 7+N+H-M=\delta \cdot k$.
b. $\quad \mathrm{R}=7$ and $\mathrm{E}=\beta, \quad 8+\mathrm{N}+\mathrm{H}-\mathrm{M}=\delta \cdot \mathrm{k}$.
c. $R=4$ and $E=7, \quad 3+N+H-M=\delta \cdot k$.
d. $R=7$ and $E=a, \quad 6+N+H-M=\delta \cdot k$.
e. $R=9$ and $E=\gamma, 8+H+N-M=\delta \cdot k$ 。

From the previous table we observe that there are exactly three choices for $N$. Using these in the above cases reduces the problem to an equation involving only $H$ and $M$ and only three choices for these. Thus we obtain two distinct solutions (actually four since $S$ and $Y$ can be interchanged).

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S or Y | P | W | V | H | L | R | M | $\phi$ | N | E | S or Y | I | T |
| M | P | W | V | S or Y | L | R | N | $\phi$ | S or Y | E | I | H | T |

Also solved by the proposer and partially solved by J.A.H. Hunter.
AND ANOTHER SUM
B-50 Proposed by Douglas Lind, Falls Cburch, Virginia
Prove that

$$
\sum_{j=0}^{n}\left[2 F_{j}^{2}-\left({\underset{j}{j}}_{n}\right) F_{j}\right]=F_{n}^{2}
$$

Solution by David Zeitlin, Minneapolis, Minnesota.
Since

$$
\sum_{j=0}^{n} F_{j}^{2}=F_{n} F_{n+1},
$$

$$
\mathrm{n}
$$

$$
\underset{j=0}{\sum}\binom{n}{j} F_{j}=F_{2 n}=F_{n} L_{n}=F_{n}\left(F_{n+1}+F_{n-1}\right),
$$

the desired sum is

$$
2 F_{n} F_{n+1}-F_{n} F_{n+1}-F_{n} F_{n-1}=F_{n}\left(F_{n+1}-F_{n-1}\right)=F_{n}^{2} .
$$

Also solved by H.H. Ferns, Farid K. Sbuayto, Sheryl B. Tadlock, and the proposer.
