ON THE INTEGER SOLUTION OF THE EQUATION

\[ 5x^2 + 6x + 1 = y^2 \]

AND SOME RELATED OBSERVATIONS

Edgar I. Emerson
Boulder, Colorado

The integer solution of the equation

(1) \[ 5x^2 + 6x + 1 = y^2 \]

is interesting because of the Fibonacci and Lucas relationships that appear.

One method of solving the problem involves the solution of the Pythagorean, (Py), equation

(2) \[ X^2 + Y^2 = Z^2, \]

where \( X = 2ab, \) \( Y = a^2 - b^2, \) \( Z = a^2 + b^2, \) and \( a > b. \) Since no other restrictions are placed on \( a \) and \( b \) this solution of (2) is not necessarily primitive.

When \( 4x^2 \) is added to both sides of (1) we obtain

(3) \[ 9x^2 + 6x + 1 = y^2 + 4x^2 \]

or

(4) \[ (3x+1)^2 = y^2 + (2x)^2. \]

Now let

(5a) \[ 3x+1 = Z = a^2 + b^2, \]

(5b) \[ y = Y = a^2 - b^2 \]

and

(5c) \[ 2x = X = 2ab \]

or

(5d) \[ x = ab. \]

Substituting this value of \( x \) in (5a) we get

(6) \[ a^2 - 3ab + (b^2 ± 1) = 0. \]

Solving this equation for \( a > b \) we have

(7) \[ a = \frac{3b + \sqrt{9b^2 - 4(b^2 ± 1)}}{2} = \frac{3b + \sqrt{5b^2 ± 4}}{2} \]
If the values of \( b \) are such that \( 5b^2 \pm 4 = \square \) then \( 3b + \sqrt{5b^2 \pm 4} \) is always even and therefore \( a \) is always integral. Changing equation (7) to

\[
2a = 3b + \sqrt{5b^2 \pm 4}
\]

we prepare Table I by filling in the column under \( b \) with the Fibonacci numbers, \( F \), and the column beneath the radical sign with the Lucas numbers, \( L \). The rest of the table is then calculated.

From (9) we have the interesting recurrent equation

\[
x_n = 2(x_{n-1} + x_{n-2}) - x_{n-3}
\]

From (9) we have the interesting recurrent equation

\[
x_n = 2(x_{n-1} + x_{n-2}) - x_{n-3}
\]
which can be expressed with Fibonacci terms as:

\[(11) \quad F_{n+1}^2 - (-1)^n = 2 \left( F_n^2 - (-1)^{n-1} + F_{n-1}^2 - (-1)^{n-2} \right) - \left[ F_{n-3}^2 - (-1)^{n-3} \right].\]

The \((-1)\) terms disappear so that

\[(12) \quad F_{n+1}^2 = 2F_n^2 + 2F_{n-1}^2 - F_{n-2}^2 \quad \text{or} \quad F_{n+1}^2 - F_{n-1}^2 = (F_n^2 - F_{n-2}^2) + (F_n^2 + F_{n-1}^2) \quad \text{or} \quad F_{2n} = F_{2n-2} + F_{2n-1} \quad \text{or} \quad F_{2n} = F_{2n}^2 \]

and thus we have proved (11) and (12). Equation (12) can be written as

\[(13) \quad 2F_{n+1}^2 = F_{n+1}^2 + F_{n-2}^2 \]

an interesting Fibonacci identity. Another interesting Fibonacci identity turns up when the appropriate \(F\) and \(L\) terms are substituted in equation (8), \(2a = 3b + \sqrt{5b^2 - 4}\). We have

\[(14) \quad 2F_{n+2} = 3F_n + L_n.\]

This identity is proved by adding \(3F_n\) to each side of the identity \(F_{n-1} + F_{n+1} = L_n\) as follows:

\[
\begin{align*}
F_{n-1} + F_{n+1} &= L_n \\
F_n + F_n + F_n &= 3F_n \\
F_n + (F_n + F_{n-1}) + (F_{n+1} + F_n) &= 3F_n + L_n \\
(F_n + F_{n+1}) + F_{n+2} &= 3F_n + L_n \\
F_{n+2} + F_{n+2} &= 3F_n + L_n \\
2F_{n+2} &= 3F_n + L_n
\end{align*}
\]
ON THE INTEGER SOLUTION OF THE EQUATION

Equation (1) can be written as

\[ 5x_n^2 + 6(-1)^n x_n + 1 = y_n^2 \]

and when the appropriate \( F \) terms are substituted, this equation becomes

\[ 5F_{n+2}^2 + 6(-1)^n F_n F_{n+2} + 1 = F_{2n+2}^2 \]

which equation is equivalent to

\[ 5F_{n-1}^2 F_{n+1}^2 - 6(-1)^n F_{n-1} F_{n+1} + 1 = F_{2n}^2 \]

or

\[ 5 \left[ F_n^2 + (-1)^n \right]^2 - 6(-1)^n \left[ F_n^2 + (-1)^n \right] + 1 = F_{2n}^2 = L_n^2 F_n^2. \]

When the indicated operations are performed we have successively

\[ 5 \left[ F_n^2 + (-1)^n F_n^2 \right] - 6(-1)^n \left[ F_n^2 + (-1)^n \right] + 1 = L_n^2 F_n^2 \]
\[ 5F_n^4 + 10(-1)^n F_n^2 + 5 - 6(-1)^n F_n^2 - 6(-1)^n + 1 = L_n^2 F_n^2 \]
\[ 5F_n^4 + 4(-1)^n F_n^2 = L_n^2 F_n^2 \]
\[ 5F_n^2 + 4(-1)^n = L_n^2 \]

and thus we have proved the identities (16) and (17).

Now we examine the solution of equation (2), \( X^2 + Y^2 = Z^2 \), where \( F \) and \( L \) terms are used for (a) and (b). For this purpose we first prepare Table II where the \( a' \)s and \( b' \)s are transferred from Table I. The rest of Table II is then calculated.

The solution of \( X^2 + Y^2 = Z^2 \) is

\[ X = 2ab = 2F_n F_{n+2} \]
\[ Y = a^2 - b^2 = F_n^2 F_{n+2} - F_n^2 = F_{2n+2} \]
\[ Z = a^2 + b^2 = F_n^2 + F_n^2 = 3F_{n+1}^2 - 2(-1)^n. \]
1966  

\[ 5x^2 + 6x + 1 = y^2 \]  

AND SOME RELATED OBSERVATIONS  67

Table II  

Showing Fibonacci and Lucas Relationships 

Involved in the Solution of  \[ X^2 + Y^2 = Z^2 \]

\[ X = 2ab, \ Y = a^2 - b^2, \ Z = a^2 + b^2, \ a = F_{n+2}, \text{ and } b = F_n. \]

\[ \begin{align*}
\frac{n}{F_{n+2}}F_n, \quad 2F_nF_{n+2}, \quad F_n^2 - F_{n+2}^2, \quad F_n^2 + F_{n+2}^2, \quad F_{n+1}, \quad L_{n+1} \\
2\left[ F_{n+1}^2 - (-1)^n \right], \quad F_{2n+2}' \quad (L_{n+1}^2 + F_{n+1}'^2)/2, \\
(L_{n+1}^2 - F_{n+1}'^2)/2, \quad L_{n+1}F_{n+1}', \quad 3F_{n+1}^2 - 2(-1)^n \end{align*} \]

The identity (18c), \( F_{n+2}^2 + F_n^2 = 3F_{n+1}^2 - 2(-1)^n \), is equivalent to

\[ (19) \]

\[ F_{n+1}^2 + F_n^2 = 3F_{n+1}^2 - 2(-1)^n \]

but

\[ F_{n+1}F_{n-1} = F_n^2 + (-1)^n \]

and

\[ 2F_{n+1}F_{n-1} = 2F_n^2 + 2(-1)^n \]

and therefore

\[ F_{n+1}^2 + F_n^2 = 2F_{n+1}F_{n-1} + F_n^2 \]

or

\[ F_{n+1}^2 - 2F_{n+1}F_{n-1} + F_{n-1}^2 = F_n^2 \]

or

\[ (F_{n+1} - F_{n-1})^2 = F_n^2 \]

or

\[ F_{n+1} - F_{n-1} = F_n \]

or

\[ F_{n+1} = F_n + F_{n-1} \]
ON THE INTEGER SOLUTION OF THE EQUATION  

and thus we have proved the Fibonacci identity for \( Z \) in (18c).

An equivalent equation for \( X^2 + Y^2 = Z^2 \) is the following Fibonacci identity:

\[
4 \left[ F_{n+1}^2 - (-1)^n \right]^2 + F_{2n+2}^2 = \left[ 3F_{n+1}^2 - 2(-1)^n \right]^2 .
\]

When the indicated operations are performed and the terms are collected this equation becomes

\[
5F_{n+1}^2 - 4(-1)^n F_{n+1}^2 = F_{2n+2}^2  \quad \text{or}
\]
\[
5F_{n+1}^2 + 4(-1)^n F_{n+1}^2 = F_{2n}^2 L_n^2  \quad \text{or}
\]
\[
5F_{n+1}^2 + 4(-1)^n = L_n^2
\]

and thus we have proved the Fibonacci identity expressed by equation (20).

The following equations represent further observations.

\[
Z + X = a^2 + 2ab + b^2 = (a+b)^2 = (F_{n+2} + F_n)^2 = L_{n+1}^2
\]

and

\[
Z - X = a^2 - 2ab + b^2 = (a-b)^2 = (F_{n+2} - F_n)^2 = F_{n+1}^2
\]

Adding these equations and dividing by 2 we have

\[
Z = \frac{(L_{n+1}^2 + F_{n+1}^2)}{2}
\]

and subtracting the equations and dividing by 2 we get

\[
X = \frac{(L_{n+1}^2 - F_{n+1}^2)}{2}
\]

and multiplying (21) by (22) we obtain

\[
Z^2 - X^2 = L_{n+1}^2 F_{n+1}^2 = Y^2
\]

\[
Y = L_{n+1} F_{n+1}
\]

The area, \( A \), of the Py triangle is

\[
A = ab(a^2 - b^2)
\]
In general, the module, \(ab(a^2-b^2)\), is divisible by 6, consequently when the appropriate \(F\) and/or \(L\) terms are substituted in the module the resulting expression must likewise be divisible by 6. Thus the following expressions are all divisible by 6:

\[
F_n F_{n+2}(F_{n+2}^2-F_n^2); \quad [F_{n+1}^2-(-1)^n][F_{n+2}^2-F_n^2];
\]

\[
F_n F_{n+1}F_{n+2}L_{n+1}; \quad F_n F_{n+2}F_{2n+2};
\]

\[
[F_{n+1}^2-(-1)^n]F_{2n+2}; \quad [F_{n+1}^2-(-1)^n]F_{n+1}L_{n+1},
\]

and

\[
(L_{n+1}^2-F_{n+1}^2)L_{n+1}F_{n+1}
\]

or

\[
(L_{n+1}^2-F_{n+1}^2)F_{2n+2}
\]

or

\[
(L_{n+1}^2-F_{n+1}^2)(F_{n+2}^2-F_n^2)
\]

are all divisible by 24 since \(ab = (L_{n+1}^2-F_{n+1}^2)/4\).

In the foregoing considerations the values of \(a\) and \(b\) were restricted by equation (1) to \(a = F_{n+2}, b = F_n\). If now, in the solution of a Py triangle, we substitute for \(a\) and \(b\) any arbitrary \(F\) and/or \(L\) terms then Fibonacci and/or Lucas number identities are easily produced in infinite variety and divisibility expressions are easily produced and proved.
