# CONJUGATE GENERALIZED FIBONACCI SEQUENCES 

Charles H. King<br>San Jose, California

## 1. INTRODUCTION

The famous rabbit problem of Leonardo Fibonacci gives the sequence

$$
\begin{equation*}
1,1,2,3,5,8,13,21,34,55,89, \ldots \tag{1}
\end{equation*}
$$

where each element is the number of rabbits present in that time period. In 1634, Albert Girard discovered the law,

$$
\begin{equation*}
\mathrm{U}_{\mathrm{n}+2}=\mathrm{U}_{\mathrm{n}+1}+\mathrm{U}_{\mathrm{n}} \tag{2}
\end{equation*}
$$

for the sequence (1). Any pair of positive integers $U_{n}$ and $U_{n+1}$ substituted in (2) generates a sequence; if $\mathrm{U}_{1}=1$ and $\mathrm{U}_{2}=2$ the Fibonacci Sequence is generated and $U_{1}=1, U_{2}=3$ generates the Lucas Sequence.

Consider any pair ( $a_{n}, a_{n+1}$ ) used in the generating function (2); if $a_{n}$ $>a_{n+1}$ then $a_{n}$ must be the first element of the sequence, because no positive integer added to $a_{n}$ will make the sum smaller, and the same sequence may be generated by the pair $\left(a_{n+1}, a_{n+2}\right)$ thus the restriction $a_{n} \leq a_{n+1}$ with no loss of generality. Continuing with the pair ( $a_{n}, a_{n+1}$ ) thus restricted the generating function (2). $\mathrm{U}_{\mathrm{n}-1}=\mathrm{U}_{\mathrm{n}+1}-\mathrm{U}_{\mathrm{n}}$ shows that as n decreases the elements in the sequence become smaller and thus there must be a least positive element. In the case of the Fibonacci Sequence there are two equal least positive elements both one. Let $a_{1}$ be the least positive element for some sequence and $a_{2}$ the next element for increasing $n$ then the pair $\left(a_{1}, a_{2}\right)$ characterize the sequence.

If the pair $\left(a_{1}, a_{2}\right)$ have a common factor, $\left(a_{1}, a_{2}\right)=k$, then all elements of the sequence have the same common factor and the sequence may be represented by another relatively prime pair $\left(a_{1}^{\prime}, a_{2}^{\prime}\right)=1$ where,

$$
\mathrm{a}_{1}^{\prime}=\frac{\mathrm{a}_{1}}{\mathrm{k}}, \quad \mathrm{a}_{2}^{\prime}=\frac{\mathrm{a}_{2}}{\mathrm{k}} .
$$

When the elements of the sequence generated by ( $a_{1}^{1}, a_{2}^{f}$ ) are multiplied by $k$ the original sequence is recovered. A sequence is a primitive sequence if $\left(a_{1}, a_{2}\right)=1$. For any pair where $a_{2}>2$, then $2 a_{1}<a_{2}$. If $2 a_{1} K a_{2}$ then there would be some $a_{0}>0$ such that $a_{0}+a_{1}=a_{2}$ where $a_{0}<a_{1}$ and $a_{1}$ would not be the least positive element. Thus any sequence generated by (2) may be defined by a positive pair of integers $\left(a_{1}, a_{2}\right)=1$ and $2 a_{1}<a_{2}$. The exception, of course, is the Fibonacci Sequence.

## 2. DEFINITION OF CONJUGATES

From the pair $\left(a_{1}, a_{2}\right)$ it has been shown that $a_{1}$ is the least positive element in the sequence that $\left(a_{1}, a_{2}\right)$ defines, but there is also a number $a_{0}$ satisfying (2), $a_{0}+a_{i}=a_{2}$. For the Fibonacci Sequence $a_{0}=0$ and $a_{0}=2$ for the Lucas Sequence. If negative elements are allowed then there is an $a_{-1}$ satisfying $a_{-1}+a_{0}=a_{1}$ and $a_{-2}, a_{-3}, a_{-4}{ }^{\prime \prime \prime}$ can be found. Thus there are values positive or negative for all $\mathrm{a}_{-\mathrm{n}}$.

The absolute values of the elements of the sequence formed by $a_{-n}$ form a sequence which is called the conjugate sequence of the original positive sequence. The element $a_{0}$ is the zero ${ }^{\text {th }}$ element of both sequences. If the elements of the conjugate sequence equal the elements of the original sequence (if $a_{n}=\left|a_{-n}\right|$ ) the sequence is called self-conjugate. The Fibonacci and Lucas Sequences are the only self-conjugate Fibonacci-Type sequences. Given a pair ( $a_{1}, a_{2}$ ) defining a sequence, the pair ( $a_{1}^{\star}, a_{2}^{\star}$ ) defining its conjugate sequence may be found by solving the equations,

$$
\begin{equation*}
\mathrm{a}_{1}^{\star}=\mathrm{a}_{2}-2 \mathrm{a}, \quad \mathrm{a}_{2}^{\star}=2 \mathrm{a}_{2}-3 \mathrm{a}, \tag{3}
\end{equation*}
$$

These pairs $\left(a_{1}, a_{2}\right)$ and $\left(a_{1}^{*}, a_{2}^{\star}\right)$ are called conjugate pairs. The conjugate sequences and pairs are illustrated in the table below.

Table 1

| $\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right)$ | $\left(\mathrm{a}_{1}^{\star}, \mathrm{a}_{2}^{\star}\right)$ | $\mathrm{U}-4$ | $\mathrm{U}-3$ | $\mathrm{U}_{-2}$ | $\mathrm{U}-1$ | $\mathrm{U}_{0}$ | $\mathrm{U}_{1}$ | $\mathrm{U}_{2}$ | $\mathrm{U}_{3}$ | $\mathrm{U}_{4}$ |
| :---: | :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $(1,1)$ | $(1,1)$ | -3 | 2 | -1 | 1 | 0 | 1 | 1 | 2 | 3 |
| $(1,3)$ | $(1,3)$ | 7 | -4 | 3 | -1 | 2 | 1 | 3 | 4 | 7 |
| $(1,4)$ | $(2,5)$ | 2 | -7 | 5 | -2 | 3 | 1 | 4 | 5 | 9 |
| $(2,5)$ | $(1,4)$ | 9 | -5 | 4 | -1 | 3 | 2 | 5 | 7 | 12 |
|  |  |  |  |  |  |  |  |  |  |  |

## 3. THE CHARACTERISTIC NUMBER D

With any pair $\left(a_{1}, a_{2}\right)$ there is a number $D$ determined by the equation

$$
\begin{equation*}
\mathrm{D}=\mathrm{a}_{2}^{2}-\mathrm{a}_{1}\left(\mathrm{a}_{1}+\mathrm{a}_{2}\right) \tag{4}
\end{equation*}
$$

A table of $D$ less than 1000 is given in [1]. For a pair $\left(a_{1}, a_{2}\right)$ determining a $D$ there is associated another conjugate pair (except $(1,1)$ and $(1,3)$ that also determine the same $D$. These pairs are conjugate pairs as defined above. All prime D greater than 5 have the form $\mathrm{P}_{\mathrm{i}}=(10 \mathrm{k} \pm 1)$ and all composite D are in the form,

$$
\begin{equation*}
\mathrm{D}=5^{\alpha_{0}} \mathrm{P}_{1}^{\alpha_{1}} \mathrm{P}_{2}^{\alpha_{2}} \mathrm{P}_{3}^{\alpha_{3}} \ldots \mathrm{P}_{\mathrm{n}}^{\alpha_{\mathrm{n}}} \tag{5}
\end{equation*}
$$

all $P_{i}$ are prime $D$ of the form ( $10 \mathrm{k} \pm 1$ ).
There may be more than one set of conjugate pairs that give a D. For D less than 1000, the number of conjugate pairs associated with any D may be found from the factorization of D as follows,

$$
\begin{equation*}
\mathrm{D}=5^{\alpha_{0}} \mathrm{P}_{1}^{\alpha_{1}} \mathrm{P}_{2}^{\alpha_{2}} \ldots \mathrm{P}_{\mathrm{n}}^{\alpha_{\mathrm{n}}} \tag{6}
\end{equation*}
$$

1. One pair $\left\{\begin{array}{l}\alpha_{0} \neq 0, \text { or } \\ \text { any } \alpha_{i}=2\end{array}\right.$
2. Two pair, $\alpha_{0}=0$, all $d_{i}<2$, and at least 2 distinct $P_{i}$.

Any two adjacent elements, $U_{n}, U_{n+1}$ from any primitive sequence substituted in the generating function,

$$
\begin{equation*}
\mathrm{U}_{\mathrm{n}} \cdot \mathrm{U}_{\mathrm{n}+1}+\left(\mathrm{U}_{\mathrm{n}}+\mathrm{U}_{\mathrm{n}+1}\right)^{2} \tag{7}
\end{equation*}
$$

will give a number from the set of $D_{3}$. From the Fibonacci Sequence

$$
[1,1] \rightarrow 5,[1,2] \longrightarrow 11,[2,3] \longrightarrow 31,[3,5] \longrightarrow 79
$$

When a D is determined by (7) a conjugate pair that determine the same D by (4) may be found from the adjacent elements used in (7). Let ( $\mathrm{F}_{\mathrm{n}}, \mathrm{F}_{\mathrm{n}+1}$ ) be the adjacent elements that give $\mathrm{D}_{\mathrm{n}}$ from (7) then a conjugate pair that deter- mine the same $D_{n}$ from (4) is

$$
\begin{equation*}
\left(\mathrm{F}_{\mathrm{n}}, \mathrm{~F}_{\mathrm{n}}+\mathrm{F}_{\mathrm{n}+2}\right),\left(\mathrm{F}_{\mathrm{n}+1}, \mathrm{~F}_{\mathrm{n}+3}\right) \tag{8}
\end{equation*}
$$

For example the Fibonacci Sequence $1,1,2,3,5,8,13, \ldots$ take the adjacent pair $[2,3]$ in (7); this gives $D=31$. The conjugate pair that give $D=$ 31 from ( 4 ) is $(2,7),(3,8)$ and from (8) where

$$
\mathrm{F}_{\mathrm{n}}=2, \quad \mathrm{~F}_{\mathrm{n}+1}=3, \quad \mathrm{~F}_{\mathrm{n}+2}=5, \quad \mathrm{~F}_{\mathrm{n}+8}=8
$$

the pair is also $(2,7)(3,8)$.
If (7) is used to generate $D$ 's by using all adjacent elements in all primitive sequences then all $D$ will be generated and each will appear the number of times equal to the number of conjugate pairs associated with it.

## ERRATA

Please make the following corrections on the article, "A Primer for the Fibonacci Numbers, Part VI, " appearing in the December, 1967, Vol. 5, No. 5, issue of the Fibonacci Quarterly, pp. 445-460:
p. 446: In the fifth line from the bottom, replace "indeterminant" with "indeterminate."
p. 452: In the line before relation (3.5), insert "of" before $x$.
p. 455: In the ninth line from the bottom, replace (3.3) by (3.4).

Please make the following correction in the Vol. Index, Vol. 5, No. 5, December, 1967, issue of the Fibonacci Quarterly: Change S. D. Mohanty to S. G. Mohanty on p. 495 .
