PRODUCTS OF FIBONACCI AND LUCAS NUMBERS

H. H. FERNS Victoria, B.C., Canada

Let U_{x_i} denote a Fibonacci or a Lucas number and consider the product

$$\mathbf{U}_{\mathbf{x}_1}\mathbf{U}_{\mathbf{x}_2}\cdots\mathbf{U}_{\mathbf{x}_n}$$

We are interested in finding a general method by which this product may be "expanded," i.e., expressed as a linear function of Fibonacci or Lucas numbers.

Beginning with the case in which n = 2 we find that there are four types of such products. Using Binet's formulas it is easily verified that these may be expressed as follows:

$$F_{x_{1}} L_{x_{2}} = F_{x_{1}+x_{2}} + (-1)^{x_{2}} F_{x_{1}-x_{2}}$$

$$L_{x_{1}} F_{x_{2}} = F_{x_{1}+x_{2}} - (-1)^{x_{2}} F_{x_{1}-x_{2}}$$

$$L_{x_{1}} L_{x_{2}} = L_{x_{1}+x_{2}} + (-1)^{x_{2}} L_{x_{1}-x_{2}}$$

$$F_{x_{1}} F_{x_{2}} = \frac{1}{5} [L_{x_{1}+x_{2}} - (-1)^{x_{2}} L_{x_{1}-x_{2}}]$$

From these four identities we make the following observations.

This "multiplication" is not commutative.

The product of a mixed pair (i.e., one factor is a Fibonacci number and the other is a Lucas number) is a linear function of Fibonacci numbers. The product of a Fibonacci and Lucas number is a function of Lucas numbers.

The coefficient of the second term is $(-1)^{X_2}$ or $-(-1)^{X_2}$ according as x_2 comes from the subscript of a Lucas or a Fibonacci number.

The factor 1/5 occurs when both numbers in the product are Fibonacci.

For convenience we denote -1 by ϵ . Now consider ϵ^{X_i} as playing a dual role. As a coefficient of L_x or F_x it has the value $(-1)^{X_i}$. As an operator applied to these numbers it reduces their subscripts by $2x_i$. With this in mind, we may write

$$\begin{split} \mathbf{F}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} &= (1 + \boldsymbol{\epsilon}^{\mathbf{X}_{2}}) \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2}} = \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2}} + (-1)^{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{1} - \mathbf{X}_{2}} \\ \mathbf{L}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} &= (1 - \boldsymbol{\epsilon}^{\mathbf{X}_{2}}) \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2}} = \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2}} - (-1)^{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{1} - \mathbf{X}_{2}} \\ \mathbf{L}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} &= (1 + \boldsymbol{\epsilon}^{\mathbf{X}_{2}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2}} = \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2}} + (-1)^{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{1} - \mathbf{X}_{2}} \\ \mathbf{F}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} &= (1 - \boldsymbol{\epsilon}^{\mathbf{X}_{2}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2}} = \frac{1}{5} \Big[\mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2}} - (-1)^{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{1} - \mathbf{X}_{2}} \Big]. \end{split}$$

We turn now to products containing three factors such as $L_{x_1} L_{x_2} F_{x_3}$. For the moment we shall understand that $L_{x_1} L_{x_2} F_{x_3}$ means $(L_{x_1} L_{x_2})$. F_{x_3} . Then, making use of the above results, we have

$$(L_{x_{1}} L_{x_{2}})F_{x_{3}} = \begin{bmatrix} L_{x_{1}+x_{2}} + (-1)^{x_{2}}L_{x_{1}-x_{2}} \end{bmatrix}F_{x_{3}}$$

$$= L_{x_{1}+x_{2}} F_{x_{3}} + (-1)^{x_{2}} L_{x_{1}-x_{2}} F_{x_{3}}$$

$$= F_{x_{1}+x_{2}+x_{3}} - (-1)^{x_{3}} F_{x_{1}+x_{2}-x_{3}} + (-1)^{x_{2}} \times \\ \times \begin{bmatrix} F_{x_{1}-x_{2}+x_{3}} - (-1)^{x_{3}} L_{x_{1}-x_{2}-x_{3}} \end{bmatrix}$$

$$= F_{x_{1}+x_{2}+x_{3}} - (-1)^{x_{3}} F_{x_{1}+x_{2}-x_{3}} + (-1)^{x_{2}} \times \\ \times F_{x_{1}-x_{2}+x_{3}} - (-1)^{x_{3}} F_{x_{1}+x_{2}-x_{3}} + (-1)^{x_{2}} \times \\ \times F_{x_{1}-x_{2}+x_{3}} - (-1)^{x_{2}+x_{3}} L_{x_{1}-x_{2}-x_{3}}$$

Using $\boldsymbol{\epsilon}^{\mathbf{X}_{i}}$ we arrive at the same result.

$$L_{X_1}L_{X_2}F_{X_3} = (1 + \epsilon^{X_2})(1 - \epsilon^{X_3})F_{X_1+X_2+X_3}$$

$$= (1 + \epsilon^{X_2}) F_{X_1 + X_2 + X_3} - (-1)^{X_3} F_{X_1 + X_2 - X_3}$$

$$= F_{X_1 + X_2 + X_3} - (-1)^{X_3} F_{X_1 + X_2 - X_3} + (-1)^{X_2} F_{X_1 - X_2 + X_3} - (-1)^{X_2 + X_3} \times F_{X_1 - X_2 - X_3} \cdot F_{X_1 - X_2 - X$$

9

Since

$$(1 + \epsilon^{X_2})(1 - \epsilon^{X_3}) = 1 + \epsilon^{X_2} - \epsilon^{X_3} - \epsilon^{X_2+X_3}$$

we could proceed as follows:

$$\begin{split} \mathbf{L}_{\mathbf{X}_{1}}\mathbf{L}_{\mathbf{X}_{2}}\mathbf{F}_{\mathbf{X}_{3}} &= (1 + \epsilon^{\mathbf{X}_{2}} - \epsilon^{\mathbf{X}_{3}} - \epsilon^{\mathbf{X}_{2} + \mathbf{X}_{3}})\mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \\ &= \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} + (-1)^{\mathbf{X}_{2}}\mathbf{F}_{\mathbf{X}_{1} - \mathbf{X}_{2} + \mathbf{X}_{3}} - (-1)^{\mathbf{X}_{3}}\mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2} - \mathbf{X}_{3}} - (-1)^{\mathbf{X}_{2} + \mathbf{X}_{3}} \\ &\times \mathbf{F}_{\mathbf{X}_{1} - \mathbf{X}_{2} - \mathbf{X}_{3}} \cdot \end{split}$$

We leave it as an exercise to show that $L_{x_1}(L_{x_2}F_{x_3})$ when expanded by any of these methods leads to the same result.

There are eight types of products, each consisting of three factors. We list them below.

$$F_{x_{1}}L_{x_{2}}L_{x_{3}} = (1 + \epsilon^{x_{2}})(1 + \epsilon^{x_{3}})F_{x_{1}+x_{2}+x_{3}}$$

$$L_{x_{1}}F_{x_{2}}L_{x_{3}} = (1 - \epsilon^{x_{2}})(1 + \epsilon^{x_{3}})F_{x_{1}+x_{2}+x_{3}}$$

$$L_{x_{1}}L_{x_{2}}F_{x_{3}} = (1 + \epsilon^{x_{2}})(1 - \epsilon^{x_{3}})F_{x_{1}+x_{2}+x_{3}}$$

$$\begin{split} \mathbf{F}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} &= \frac{1}{5} (1 - \epsilon^{\mathbf{X}_{2}})(1 - \epsilon^{\mathbf{X}_{3}}) \mathbf{F}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \\ \mathbf{L}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} &= \frac{1}{5} (1 - \epsilon^{\mathbf{X}_{2}})(1 - \epsilon^{\mathbf{X}_{3}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \\ \mathbf{F}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} &= \frac{1}{5} (1 + \epsilon^{\mathbf{X}_{2}})(1 - \epsilon^{\mathbf{X}_{3}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \\ \mathbf{F}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{3}} &= \frac{1}{5} (1 - \epsilon^{\mathbf{X}_{2}})(1 + \epsilon^{\mathbf{X}_{3}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \\ \mathbf{L}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{3}} &= (1 + \epsilon^{\mathbf{X}_{2}})(1 + \epsilon^{\mathbf{X}_{3}}) \mathbf{L}_{\mathbf{X}_{1} + \mathbf{X}_{2} + \mathbf{X}_{3}} \end{split}$$

The preceding results are the bases for the following conjecture.

Let $U_{\mathbf{X_{i}}}$ represent a Fibonacci or a Lucas number. Let p be the number of Fibonacci numbers in a product of both Fibonacci and Lucas numbers. Let

$$\overline{U}_{x_1+x_2+\cdots+x_n}$$

denote a Fibonacci or a Lucas number according as p is odd or even. As a coefficient ϵ^{x_i} has the numerical value (-1)^{x_i} but as an operator applied to

$$\overline{\boldsymbol{u}}_{\boldsymbol{x_1}\!+\!\boldsymbol{x_2}\!+\!\cdots\!+\!\boldsymbol{x_n}}$$
 ,

it reduces the subscript of the latter by $2x_i$. Use

$$(1 - \epsilon^{X_i})$$
 or $(1 + \epsilon^{X_i})$

1969] PRODUCTS OF FIBONACCI AND LUCAS NUMBERS

according as \mathbf{x}_i is the subscript of a Fibonacci or a Lucas number in the product. Then

$$\prod_{i=1}^{u} U_{x_{i}} = \frac{1}{5^{\left[\frac{p}{2}\right]}} (1 \pm \epsilon^{x_{2}})(1 \pm \epsilon^{x_{3}}) \cdots (1 \pm \epsilon^{x_{n}})\overline{U}_{x_{1}+x_{2}+\cdots+x_{n}}$$

The proof of this conjecture is given at the end of this article. The following example will illustrate

$$\begin{aligned} \mathbf{F}_{15} \mathbf{F}_{12} \mathbf{L}_{10} \mathbf{F}_{8} &= \frac{1}{5} (1 - \epsilon^{12})(1 + \epsilon^{10})(1 - \epsilon^{8}) \mathbf{F}_{45} \\ &= \frac{1}{5} (1 - \epsilon^{12})(1 + \epsilon^{10})(\mathbf{F}_{45} - \mathbf{F}_{29}) \\ &= \frac{1}{5} (1 - \epsilon^{12})(\mathbf{F}_{45} - \mathbf{F}_{29} + \mathbf{F}_{25} - \mathbf{F}_{9}) \\ &= \frac{1}{5} (\mathbf{F}_{45} - \mathbf{F}_{29} + \mathbf{F}_{25} - \mathbf{F}_{9} - \mathbf{F}_{21} + \mathbf{F}_{5} - \mathbf{F}_{1} + \mathbf{F}_{-15}) \\ &= \frac{1}{5} (\mathbf{F}_{45} - \mathbf{F}_{29} + \mathbf{F}_{25} - \mathbf{F}_{21} + \mathbf{F}_{15} - \mathbf{F}_{9} + \mathbf{F}_{5} - \mathbf{F}_{1}) \quad . \end{aligned}$$

The above rule also applies if the product consists entirely of Fibonacci or of Lucas numbers each with the same subscript. For example,

$$\begin{split} \mathbf{L}_{\mathbf{X}}^{5} &= (\mathbf{1} + \boldsymbol{\epsilon}^{\mathbf{X}})^{4} \mathbf{L}_{5\mathbf{X}} \\ &= (\mathbf{1} + 4 \, \boldsymbol{\epsilon}^{\mathbf{X}} + 6 \, \boldsymbol{\epsilon}^{2\mathbf{X}} + 4 \, \boldsymbol{\epsilon}^{3\mathbf{X}} + \, \boldsymbol{\epsilon}^{4\mathbf{X}}) \mathbf{L}_{5\mathbf{X}} \\ &= \mathbf{L}_{5\mathbf{X}} + 4 (-1)^{\mathbf{X}} \mathbf{L}_{3\mathbf{X}} + 6 (-1)^{2\mathbf{X}} \mathbf{L}_{\mathbf{X}} + 4 (-1)^{3\mathbf{X}} \mathbf{L}_{-\mathbf{X}} + (-1)^{4\mathbf{X}} \mathbf{L}_{-3\mathbf{X}} \\ &= \mathbf{L}_{5\mathbf{X}} + \left[4 (-1)^{\mathbf{X}} + (-1)^{\mathbf{X}} \right] \mathbf{L}_{3\mathbf{X}} + \left[6 (-1)^{2\mathbf{X}} + 4 (-1)^{2\mathbf{X}} \right] \mathbf{L}_{\mathbf{X}} \\ &= \mathbf{L}_{5\mathbf{X}} + 5 (-1)^{\mathbf{X}} \mathbf{L}_{3\mathbf{X}} + 10 \, \mathbf{L}_{\mathbf{X}} \quad . \end{split}$$

More generally, if n is an odd integer we have

PRODUCTS OF FIBONACCI AND LUCAS NUMBERS

$$L_{X}^{n} = (1 + \epsilon^{X})^{n-1} L_{nX}$$

$$= L_{nX} + {\binom{n-1}{1}} \epsilon^{X} L_{(n-2)X} + {\binom{n-1}{2}} \epsilon^{2X} L_{(n-4)X} + \cdots$$

$$+ {\binom{n-1}{n-2}} \epsilon^{(n-2)X} L_{-(n-4)X} + {\binom{n-1}{n-1}} \epsilon^{(n-1)X} L_{-(n-2)X}$$

Since

.

.

$$L_{-k} = (-1)^{k} L_{k}$$
,

we get

...

$$\begin{split} \mathbf{L}_{\mathbf{X}}^{\mathbf{n}} &= \mathbf{L}_{\mathbf{n}\mathbf{X}} + \left[\begin{pmatrix} \mathbf{n} - 1\\ 1 \end{pmatrix} + \begin{pmatrix} \mathbf{n} - 1\\ \mathbf{n} - 1 \end{pmatrix} \right] \boldsymbol{\epsilon}^{\mathbf{X}} \mathbf{L}_{(\mathbf{n}-2)\mathbf{X}} + \left[\begin{pmatrix} \mathbf{n} - 1\\ 2 \end{pmatrix} + \begin{pmatrix} \mathbf{n} - 1\\ \mathbf{n} - 2 \end{pmatrix} \right] \boldsymbol{\epsilon}^{2\mathbf{X}} \mathbf{L}_{(\mathbf{n}-4)\mathbf{X}} \\ &+ \cdots + \left[\begin{pmatrix} \frac{\mathbf{n} - 1}{2}\\ \frac{\mathbf{n} - 1}{2} \end{pmatrix} + \begin{pmatrix} \frac{\mathbf{n} - 1}{2}\\ \frac{\mathbf{n} + 1}{2} \end{pmatrix} \right] \boldsymbol{\epsilon}^{\left(\frac{\mathbf{n} - 1}{2} \right)} \mathbf{L}_{\mathbf{X}} \end{split}$$

Making use of the identity

$$\binom{n}{m}$$
 + $\binom{n}{n-m}$ = $\binom{n+1}{m}$,

the last equation may be written

$$L_{X}^{n} = L_{nX} + {\binom{n}{1}} \epsilon^{X} L_{(n-2)X} + {\binom{n}{2}} \epsilon^{2X} L_{(n-4)X} + \dots + {\binom{n}{n-1}} \epsilon^{\frac{(n-1)}{2}X} L_{X}$$
$$L_{X}^{n} = \sum_{i=0}^{\frac{n-1}{2}} (-1)^{Xi} {\binom{n}{i}} L_{(n-2i)X} \qquad n = 1, 3, 5, \dots$$

Similarly, we get the following:

1969]

45

$$L_{x}^{n} = \sum_{i=0}^{\frac{n}{2}-1} \left[(-1)^{x_{i}} {n \choose i} L_{(n-2i)x} \right] + 2(-1)^{\frac{n}{2}x} {n-1 \choose \frac{n}{2}}$$
(n, even)

$$F_{x}^{n} = \frac{1}{\frac{n-1}{5}^{2}} \sum_{i=0}^{\frac{n-1}{2}} (-1)^{(x+1)i} {n \choose i} F_{(n-2i)x}$$
 (n, odd)

$$\mathbf{F}_{\mathbf{x}}^{n} = \frac{1}{5^{2}} \sum_{i=0}^{\frac{n}{2}-1} \left[(-1)^{(\mathbf{x}+1)i} \binom{n}{i} \mathbf{L}_{(n-2i)\mathbf{x}} \right] + 2(-1)^{\frac{n}{2}(\mathbf{x}+1)} \binom{n-1}{\frac{n}{2}} \quad (n, \text{ even})$$

The proof of the rule which has been used to express products of Fibonacci and Lucas numbers as linear functions of those numbers is a proof by induction.

We have seen that it is true for n = 2 and n = 3. Assume it is true for all integral values of n up to and including k. Then, if p is even

(1)
$$\prod_{i=1}^{k} U_{x_i} = \frac{1}{5^{\lfloor \frac{p}{2} \rfloor}} (1 \pm \epsilon^{x_2}) \cdots (1 \pm \epsilon^{x_k}) L_{x_1 \pm x_2 \pm \cdots \pm x_k}.$$

Multiplying both members of this equation by L_{x+1} we get

$$\begin{split} \prod_{i=1}^{k} \mathbf{U}_{\mathbf{x}_{i}} \mathbf{L}_{\mathbf{x}+1} &= \frac{1}{5^{\left[\frac{D}{2}\right]}} \quad (1 \pm \epsilon^{\mathbf{x}_{2}}) \cdots \quad (1 \pm \epsilon^{\mathbf{x}_{k}}) \mathbf{L}_{\mathbf{x}_{1}+\mathbf{x}_{2}+\cdots+\mathbf{x}_{k}} \mathbf{L}_{\mathbf{x}_{k}+1} \\ &= \frac{1}{5^{\left[\frac{D}{2}\right]}} \quad (1 \pm \epsilon^{\mathbf{x}_{2}}) \cdots \quad (1 \pm \epsilon^{\mathbf{x}_{k}}) \quad \times \\ &\times \quad (\mathbf{L}_{\mathbf{x}_{1}+\mathbf{x}_{2}+\cdots+\mathbf{x}_{k+1}} + (-1)^{k+1} \mathbf{L}_{\mathbf{x}_{1}+\mathbf{x}_{2}+\cdots+\mathbf{x}_{k}-\mathbf{x}_{k+1}}) \end{split}$$

$$= \frac{1}{5^{\left[\frac{p}{2}\right]}} (1 + \epsilon^{x_2}) \cdots (1 \pm \epsilon^{x_k})(1 + \epsilon^{x_{k+1}}) L_{x_1 + x_2 + \cdots + x_{k+1}}$$

Next, multiplying both sides of equation (1) by F_{x+1} we get

$$\begin{aligned} \left| \prod_{i=1}^{l} U_{X_{i}} F_{X_{k+1}} \right| &= \frac{1}{5^{\left[\frac{p}{2}\right]}} (1 + \epsilon^{X_{2}}) \cdots (1 \pm \epsilon^{X_{k}}) L_{X_{1} + X_{2} + \cdots + X_{k}} F_{X_{k+1}} \\ &= \frac{1}{5^{\left[\frac{p}{2}\right]}} (1 \pm \epsilon^{X_{2}}) \cdots (1 \pm \epsilon^{X_{k}}) \times \\ &\times \left[F_{X_{1} + X_{2} + \cdots + X_{k+1}} - (-1)^{X_{k+1}} F_{X_{1} + X_{2} + \cdots + X_{k} - X_{k+1}} \right] \\ &= \frac{1}{5^{\left[\frac{p}{2}\right]}} (1 \pm \epsilon^{X_{2}}) \cdots (1 \pm \epsilon^{X_{k}}) (1 - \epsilon^{X_{k+1}}) F_{X_{1} + X_{2} + \cdots + X_{k+1}} .\end{aligned}$$

Since both of these results agree with that given by the general rule for $n\ =\ k+1\ the\ induction\ is\ complete\ for\ the\ case\ in\ which$

$$\overline{\mathbf{U}}_{\mathbf{X}_1 + \mathbf{X}_2 + \cdots + \mathbf{X}_n} = \mathbf{L}_{\mathbf{X}_1 + \mathbf{X}_2 + \cdots + \mathbf{X}_n}$$

We leave the case in which

$$\overline{\mathbf{U}}_{\mathbf{x}_1 + \mathbf{x}_2 + \cdots + \mathbf{x}_n} = \mathbf{F}_{\mathbf{x}_1 + \mathbf{x}_2 + \cdots + \mathbf{x}_n}$$

for the reader to prove.

We now consider the reverse problem; that is, the problem of finding a general method of expressing

$$L_{x_1+x_2+\cdots+x_n}$$
 and $F_{x_1+x_2+\cdots+x_n}$

as a homogeneous function of products, each of the type,

$$\operatorname{F}_{x_1}\operatorname{F}_{x_2}\cdots\operatorname{F}_{x_i}\operatorname{L}_{x_{i+1}}\operatorname{L}_{x_{i+2}}\cdots\operatorname{L}_{x_n}$$
 .

k

1969] PRODUCTS OF FIBONACCI AND LUCAS NUMBERS

For simplicity let S_i^n denote the sum of all products consisting of i factors which are Fibonacci numbers and n - i which are Lucas numbers. The number of such factors is, of course, $\binom{n}{i}$.

For example,

$$\mathbf{S_2^4} = \mathbf{F}_{\mathbf{X_1}} \mathbf{F}_{\mathbf{X_2}} \mathbf{L}_{\mathbf{X_3}} \mathbf{L}_{\mathbf{X_4}} + \mathbf{F}_{\mathbf{X_1}} \mathbf{F}_{\mathbf{X_3}} \mathbf{L}_{\mathbf{X_2}} \mathbf{L}_{\mathbf{X_4}} + \mathbf{F}_{\mathbf{X_1}} \mathbf{F}_{\mathbf{X_4}} \mathbf{L}_{\mathbf{X_2}} \mathbf{L}_{\mathbf{X_3}} + \mathbf{F}_{\mathbf{X_2}} \mathbf{F}_{\mathbf{X_3}} \mathbf{L}_{\mathbf{X_1}} \mathbf{L}_{\mathbf{X_4}} + \mathbf{F}_{\mathbf{X_2}} \mathbf{F}_{\mathbf{X_4}} \mathbf{L}_{\mathbf{X_1}} \mathbf{L}_{\mathbf{X_3}} + \mathbf{F}_{\mathbf{X_3}} \mathbf{F}_{\mathbf{X_4}} \mathbf{L}_{\mathbf{X_1}} \mathbf{L}_{\mathbf{X_2}}$$

For later use we note that

$$S_{i}^{n} L_{x_{n+1}} + S_{i-1}^{n} F_{x_{n+1}} = S_{i}^{n+1}$$

This follows from the identity

$$\binom{n}{i} + \binom{n}{i-1} = \binom{n+1}{i}$$

For the case n = 2 we readily prove (using Binet's formulas) that

$$F_{x_1+x_2} = \frac{1}{2} (L_{x_1} F_{x_2} + F_{x_1} L_{x_2})$$
$$= \frac{1}{2} S_1^2$$
$$L_{x_1+x_2} = \frac{1}{2} (L_{x_1} L_{x_2} + 5 F_{x_1} F_{x_2})$$
$$= \frac{1}{2} (S_0^2 + 5 S_2^2) .$$

Using these two identities as a basis, we develop the following for n = 3

$$\begin{split} \mathbf{F}_{\mathbf{X}_{1}+\mathbf{X}_{2}+\mathbf{X}_{3}} &= \mathbf{F}_{(\mathbf{X}_{1}+\mathbf{X}_{2})+\mathbf{X}_{3}} \\ &= \frac{1}{2} \bigg[\mathbf{L}_{\mathbf{X}_{1}+\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} + \mathbf{F}_{\mathbf{X}_{1}+\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{3}} \bigg] \\ &= \frac{1}{2} \bigg[\frac{1}{2} \left(\mathbf{L}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} + 5 \mathbf{F}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \right) \mathbf{F}_{\mathbf{X}_{3}} + \frac{1}{2} \left(\mathbf{L}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} + \mathbf{F}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} \right) \mathbf{L}_{\mathbf{X}_{3}} \bigg] \\ &= \frac{1}{2^{2}} \bigg[\mathbf{L}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} + 5 \mathbf{F}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \mathbf{F}_{\mathbf{X}_{3}} + \mathbf{L}_{\mathbf{X}_{1}} \mathbf{F}_{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{3}} + \mathbf{F}_{\mathbf{X}_{1}} \mathbf{L}_{\mathbf{X}_{2}} \mathbf{L}_{\mathbf{X}_{3}} \bigg] \\ &= \frac{1}{2^{2}} \bigg[\mathbf{S}_{1}^{3} + 5 \mathbf{S}_{3}^{3} \bigg] \end{split}$$

 $L_{x_1+x_2+x_3} = L_{(x_1+x_2)+x_3}$

.

.

_

$$\begin{split} &= \frac{1}{2} \bigg[\mathcal{L}_{X_{1}+X_{2}} \mathcal{L}_{X_{3}} + 5 \mathcal{F}_{X_{1}+X_{2}} \mathcal{F}_{X_{3}} \bigg] \\ &= \frac{1}{2} \bigg[\frac{1}{2} \left(\mathcal{L}_{X_{1}} \mathcal{L}_{X_{2}} + 5 \mathcal{F}_{X_{1}} \mathcal{F}_{X_{2}} \right) \mathcal{L}_{X_{3}} + \frac{5}{2} \left(\mathcal{L}_{X_{1}} \mathcal{F}_{X_{2}} + \mathcal{F}_{X_{1}} \mathcal{L}_{X_{2}} \right) \mathcal{F}_{X_{3}} \bigg] \\ &= \frac{1}{2^{2}} \bigg[\mathcal{L}_{X_{1}} \mathcal{L}_{X_{2}} \mathcal{L}_{X_{3}} + 5 \mathcal{F}_{X_{1}} \mathcal{F}_{X_{2}} \mathcal{L}_{X_{3}} + 5 \mathcal{F}_{X_{1}} \mathcal{L}_{X_{2}} \mathcal{F}_{X_{3}} + 5 \mathcal{L}_{X_{1}} \mathcal{F}_{X_{2}} \mathcal{F}_{X_{3}} \bigg] \\ &= \frac{1}{2^{2}} \bigg[\mathcal{S}_{0}^{3} + 5 \mathcal{S}_{2}^{3} \bigg] \,. \end{split}$$

Proceeding in this manner we derive the following identities for n = 4and n = 5:

$$\begin{aligned} \mathbf{F}_{\mathbf{X}_{1}+\mathbf{X}_{2}+\mathbf{X}_{3}+\mathbf{X}_{4}} &= \frac{1}{2^{3}} \left[\mathbf{S}_{1}^{4} + 5 \ \mathbf{S}_{3}^{4} \right] \\ \mathbf{F}_{\mathbf{X}_{1}+\mathbf{X}_{2}+\mathbf{X}_{3}+\mathbf{X}_{4}+\mathbf{X}_{5}} &= \frac{1}{2^{4}} \left[\mathbf{S}_{1}^{5} + 5 \ \mathbf{S}_{3}^{5} + 5^{2} \ \mathbf{S}_{5}^{5} \right] \\ \mathbf{L}_{\mathbf{X}_{1}+\mathbf{X}_{2}+\mathbf{X}_{3}+\mathbf{X}_{4}} &= \frac{1}{2^{3}} \left[\mathbf{S}_{0}^{4} + 5 \ \mathbf{S}_{2}^{4} + 5^{2} \ \mathbf{S}_{4}^{4} \right] \end{aligned}$$

PRODUCTS OF FIBONACCI AND LUCAS NUMBERS

$$L_{X_1+X_2+X_3+X_4+X_5} = \frac{1}{2^4} \left[S_0^5 + 5 S_2^5 + 5^2 S_4^5 \right].$$

From the above results we conjecture the validity of the following identities which we will prove later.

(2)
$$F_{x_1+x_2+\cdots+x_n} = \frac{1}{2^{n-1}} \left[S_1^n + 5S_3^n + 5^2S_5^n + \cdots + \begin{pmatrix} \frac{n-2}{5}S_{n-1}^n \\ \frac{n-1}{5}S_n^n \end{bmatrix} (n, \text{ even}) \right]$$

(3)
$$L_{x_1+x_2+\cdots+x_n} = \frac{1}{2^{n-1}} \left[S_0^n + 5 S_2^n + 5^2 S_4^n + \cdots + \begin{cases} \frac{n}{5^2} S_n^n \\ \frac{n-1}{5^2} S_{n-1}^n \end{cases} \right]$$
 (n, even)
 $\left(\frac{n-1}{5^2} S_{n-1}^n \right]$ (n, odd).

Before proceeding with the proofs of these identities we consider the special case when $x_1 = x_2 = \cdots = x_n = x$. For this case we get the following:

$$\mathbf{F}_{nx} = \frac{1}{2^{n-1}} \left[\binom{n}{1} \mathbf{F}_{x} \mathbf{L}_{x}^{n-1} + 5\binom{n}{3} \mathbf{F}_{x}^{3} \mathbf{L}_{x}^{n-3} + \dots + \begin{pmatrix} \frac{n-2}{5} \binom{n}{n-1} \mathbf{F}_{x}^{n-1} \mathbf{L}_{x} \end{bmatrix} \text{(n,even)} \right]$$

$$\frac{n-1}{5} \binom{n}{2} \binom{n}{n} \mathbf{F}_{x}^{n} \end{bmatrix}$$

$$(n,odd)$$

$$\mathbf{L}_{nx} = \frac{1}{2^{n-1}} \left[\mathbf{L}_{x}^{n} + 5 \begin{pmatrix} n \\ 2 \end{pmatrix} \mathbf{F}_{x}^{2} \mathbf{L}_{x}^{n-2} + \cdots + \begin{cases} \frac{n}{5^{2}} \begin{pmatrix} n \\ n \end{pmatrix} \mathbf{F}_{x}^{n} \end{bmatrix}$$
 (n, even)
$$\frac{n-1}{5^{2}} \begin{pmatrix} n \\ n-1 \end{pmatrix} \mathbf{F}_{x}^{n-1} \mathbf{L}_{x} \end{bmatrix}$$
(n, odd)

Note, in particular, if n = 2 we get two well-known identities

$$\begin{split} {\rm F}_{2{\rm X}} &= {\rm F}_{{\rm X}}{\rm L}_{{\rm X}} \\ {\rm L}_{2{\rm X}} &= \frac{1}{2} \; ({\rm L}_{{\rm X}}^2 + 5 \; {\rm F}_{{\rm X}}^2) \;\; . \end{split}$$

and

1969]

We have now to prove the identities (1) and (2). The proof is by induction on n. Both identities are true for n = 2. We assume they are valid for all integral values of n up to and including n = k.

Then

$$(4) \quad F_{x_{1}+x_{2}+\cdots+x_{k}} = \frac{1}{2^{k-1}} \left[S_{1}^{k} + 5S_{3}^{k} + 5^{2}S_{5}^{k} + \cdots + \begin{cases} \frac{k-2}{5}S_{k-1}^{k} \end{bmatrix} (k, \text{ even}) \\ \frac{k-1}{5}S_{k}^{k} \end{bmatrix} (k, \text{ odd}) \end{cases}$$

$$(5) \quad L_{x_{1}+x_{2}+\cdots+x_{k}} = \frac{1}{2^{k-1}} \left[S_{0}^{k} + 5S_{2}^{k} + 5^{2}S_{4}^{k} + \cdots + \begin{cases} \frac{k}{5}S_{k}^{k} \end{bmatrix} (k, \text{ even}) \\ \frac{k-1}{5}S_{k}^{k} \end{bmatrix} (k, \text{ even}) \\ \frac{k-1}{5}S_{k}^{k} \end{bmatrix} (k, \text{ even}) \end{cases}$$
Now

(6) $L_{x_1+x_2+\cdots+x_k+x_{k+1}} \equiv L_{(x_1+x_2+\cdots+x_k)+x_{k+1}}$ = $\frac{1}{2} \left[L_{x_1+x_2+\cdots+x_k} L_{x_{k+1}} + 5 F_{x_1+x_2+\cdots+x_k} F_{x_{k+1}} \right].$

Applying (4) and (5) to the right member of (6), we get

(7)
$$\mathbf{L}_{\mathbf{x}_{1}+\mathbf{x}_{2}+\cdots+\mathbf{x}_{k}} \mathbf{L}_{\mathbf{x}_{k+1}} = \frac{1}{2^{k-1}} \left[\mathbf{S}_{0}^{k} \mathbf{L}_{\mathbf{x}_{k+1}} + 5 \mathbf{S}_{2}^{k} \mathbf{L}_{\mathbf{x}_{k+1}} + \cdots + \left\{ \begin{array}{c} \frac{5^{k}}{2} \mathbf{S}_{k}^{k} \mathbf{L}_{\mathbf{x}_{k+1}} \\ \frac{5^{k}}{2} \mathbf{S}_{k}^{k} \mathbf{L}_{\mathbf{x}_{k+1}} \\ \frac{k-1}{5^{k}} \mathbf{S}_{k-1}^{k} \mathbf{L}_{\mathbf{x}_{k+1}} \end{array} \right]$$
(k, even)

(8)
$$F_{x_1+x_2+\cdots+x_k} F_{x_{k+1}} = \frac{1}{2^{k-1}} \left[S_1^k F_{x_{k+1}} + 5 S_3^k F_{x_{k+1}} + \cdots + \left\{ \frac{5^{k-2}}{5} S_{k-1}^k F_{x_{k+1}} \right] (k, \text{ even}) + \left\{ \frac{\frac{k-2}{5}}{5} S_k^k F_{x_{k+1}} \right] (k, \text{ odd}) \right\}$$

Substituting in (6) from (7) and (8) and regrouping we get the following:

$$\begin{split} \mathbf{L}_{\mathbf{X}_{1}+\mathbf{X}_{2}+\cdots+\mathbf{X}_{k+1}} &= \mathbf{S}_{0}^{k+1} + 5\left(\mathbf{S}_{2}^{k} \mathbf{L}_{\mathbf{X}_{k+1}} + \mathbf{S}_{1}^{k} \mathbf{F}_{\mathbf{X}_{k+1}}\right) \\ &+ 5^{2}\left(\mathbf{S}_{4}^{k} \mathbf{L}_{\mathbf{X}_{k+1}} + \mathbf{S}_{3}^{k} \mathbf{F}_{\mathbf{X}_{k+1}}\right) + \cdots \\ &+ \begin{cases} \frac{5^{2}}{2}\left(\mathbf{S}_{k}^{k} \mathbf{L}_{\mathbf{X}_{k+1}} + \mathbf{S}_{k-1}^{k} \mathbf{F}_{\mathbf{X}_{k+1}}\right) \\ \frac{k-1}{5^{2}} \mathbf{S}_{k} \mathbf{F}_{k+1} \end{array} \right) & \text{ (k, even)} \end{cases}$$

Hence

1969]

$$L_{x_1+x_2+\cdots+x_{k+1}} = S_0^{k+1} + 5S_2^{k+1} + 5^2S_4^{k+1} + \cdots + \begin{cases} \frac{k}{5^2}S_k^{k+1} & (k+1, \text{ even}) \\ \frac{k-1}{5^2}S_{k+1}^{k+1} & (k+1, \text{ odd}) \end{cases}$$

This completes the proof of (3). The proof of (2) is similar.

ERRATA FOR PSEUDO-FIBONACCI NUMBERS

H. H. Ferns Victoria, B.C., Canada

Please make the following changes in the above-entitled article appearing in Vol. 6, No. 6:

p. 305: in Eq. (3), O_{i+1} should read: O_{i+2} . On p. 306, the 6th line from the bottom: B^{-k+1} should read: B^{k+1} . On page 310, in Eq. (12), $2O_{2n}$ should read: $2\lambda O_{2n}$; in Eq. (13), $3O_{2n+1}$ should read: $3O_{2n+1}$. Equation (17), on p. 312: $(\lambda - 2)O_{2n-1}$ should read: $\lambda(\lambda - 2)O_{2n-1}$. Equation (18s) on p. 313: $4O_i^2$ should read: $4O_i^2$. In line 3, p. 314, $2O_{2n+2}$ should read $2O_{2n+2}$, and Eq. (20), p. 315: $(\lambda - 2)O_{2n}$ should read $\lambda(\lambda - 2)O_{2n}$.
